Hello!

As title says, I'm working on a Boatanchors page. Please, visit it at:

http://www.geocities.com/SiliconValley/6992/

and add it to your Bookmarks... I'll add information often!.

In my page you can find information about the R-388, R-390A, SP-600 and
some other BAs and also about my radio station. Please, if you visit my
page, send me any comment you have about it. I'll be most grateful.

Thanks and best regards.

Subject: Standard C510A

Any wide receiver modification available for the C510A ?

Still no word on the receiver mod....maybe Standard completely eliminated
any possiblilty of a wide 800 Mhz receiver.

Anyone willing to play with RD90 RD91 RD92 and RD93 or RD76 and RD77 on the
component
side of the circuit board ? These resistors next to the main microprocessor
have to due with radio operation outside of the USA.

From: Josh Pavlovich <jpav@mtnweb.com>
Subject: -FT-50 Case info???

Does anyone have, or know where I could find a picture of the cases for
the FT-50. In particular I am interested in the new leather case
designed for the commercial version, or in the cordura case. The only
place I can find any reference to these is through mail order, and no
one seems to have a picture.

If no picture, can someone who owns one of these describe how it looks.
Do either cover the entire radio? Do they have a clear window to view
through. I really would appreciate any help anyone is able to give.

Thanks much,
Josh Pavlovich

There is a case that was originally made for the commercial version of the FT-50R, the VERTEX series. The case has a commercial belt clip, stretchable elastic on both sides, and a clear front will holes cut out for the speaker and microphone. The thing I fear most is damage of the clear display, and the plastic covers that nicely. Since the sides are elastic, the case accomodates the low power battery as well as the 9.6 volt battery.

I also have a custom case made by a local couple in town who are police officers. Problem is, most of the Motorola HTs have all controls on the top, and you can change the controls while they are in the case. Not so with the FT-50R. The case I mentioned above is the one I use. It easily slips off the belt for programming, and secure on the belt when you place it there. I am unsure of the model number, but I know AES has them for about $20.

Hope this helps! I know there is a heavy leather case out there also, but I like to be semi-inconspicuous!

From: jch.nv@rocketmail.com
Subject: AC Linr Freq. Meter

Thanks to all that read this posting.
I am looking for information on how to construct a line frequency meter for the purpose of monitoring the output and aligmnent of generators. I would like it to be able to provide a linear voltage to indicate frequency at 110VAC. A generating set that is used at a local repeater site (10kw Kohler) has a standard needle type meter that reads out from 45 to 65 cycles. I have a vibrating reed type meter at this time, but would like to constructy a meter that can be permantly attached to the generator (I have mort that one genset). I know there can't be much to the circuit, but I don't know
where to start. (The simpler the better, less chance for trouble) Please respond via e-mail if possible.

Thanks & 73,
Josh KD6KML

Subject: CABLE TV--FREE DECODER PLANS--

Now you can get new plans to build a Cable Descrambler System, US and UK plans.

This is not the origonal Radio Shack plan (now obsolete), but a choice of six new up to date plans designed to work on any cable box in any area. Just send me details of which cable box you have and in what area you reside as the plan needed will vary area to area, and you will be able to view all premium and pay per view channels.

It works on all Cable Tv Systems. The parts to make the box cost appoximately $15 (depending on the plan) and you can find them at any local electronic part supplier(US Residents will be supplied with radio shack part numbers). British Sky Cable descrablers cost approx 20 Pounds. Remember this is for educational purposes only, you still have to pay for the channels you view. I have to say that to protect myself for any liablity.

For the Plans just send $ 2 or 2 Pounds to:

Ed Hacker
409 Adams Street # 7
Hoboken, NJ 07030
USA

The reason I charge two dollars is for the stamp, envelop, and paper your plans are on. I am doing this for you not for me to make money. Lets get real you cant buy much for two bucks. I am not in this for the money but to get back at the cable companys that over charge people.

CABLE HANDBOOK (Additional $2)

Everything you ever wanted to know about cable boxes. Includes a cross reference list for upgrading your box using upgrade converts, cubes, plug-in activators and service code-generators. Also explains general cable operation, this handbook is very COMPLETE, a must have!

TURN ME ON!

Turn on all your premium channels with nothing to buy.

The Notch Filter

A notch filter allows you to selectively descramble channels. For instance, if HBO is on channel 7 and Cinemax is on channel 14 or pay-per-view is on 22, you may build a notch filter to descramble each of those channels. This method is fairly simple to build; However, it requires several more parts than the Fifteen Dollar Box. This system will work on your cable system, no

matter what frequency your cable system operates on. A cable box is NOT REQUIRED, and parts cost in the range of $25-30 depending on how many channels pay channels you wish to descramble. NOTE: I used channel 7,14 and 22 as an example. Your premium services may be on other channels and the notch filter can be built for whatever channel your premium services are on. (between the range of 2-22) Parts can be purchased from a electronics wholesaler/retailer in your phone.

The Gated Sync is the Grand Daddy of descramblers (in band and out band). It can be configured to operate on your cable systems frequency. This system is for the serious home electronics buff. It is a bit more complex to build; However, it sells for a lot of money. And, it will descramble EVERY channel.

SSAVI was created by Zenith, and used by many Zenith converters. The system is very difficult to build, but it will descramble EVERY channel, and also sells for a lot of money. Novices should not attempt to build the SSAVI system.

FREQUENTLY ASKED QUESTIONS

What is a Descrambler?

A descrambler is a device that restores the picture and sound of a scrambled channel. In most cases, ALL channels which are scrambled will be restored.

Are Descramblers legal?

YES! It is legal to build, sell, ship, use, and own a descrambler; However, when you use a descrambler, it is your responsibility to notify the cable company that you are accessing their signal.

Do I need a converter from my cable company?

In most cases NO. A cable ready VCR or TV will work.

Is it difficult to build a descrambler?

Turn me on, the Fifteen Dollar Box, the Oak converter and the Foil method are very simple methods! The instructions provide step by step instructions. No special skill or knowledge are needed. The Notch filter is still fairly simple. The Gated Sync is not for the beginner, it requires electronics knowledge.

Can I build more than one?

YES! You may build as many descramblers as you want! They are legal to sell and demand fairly high prices!

Just send me details of which cable box you have and in what area you reside as the plan needed will vary area to area
For the Plans just send $ 2 or 2 Pounds to:

Ed Hacker

Subject: -FT-50 Case info???

Does anyone have, or know where I could find a picture of the cases for
the FT-50. In particular I am interested in the new leather case
designed for the commercial version, or in the cordura case. The only
place I can find any reference to these is through mail order, and no
one seems to have a picture.

If no picture, can someone who owns one of these describe how it looks.
Do either cover the entire radio? Do they have a clear window to view
through. I really would appreciate any help anyone is able to give.

Thanks much,
Josh Pavlovich

There is a case that was originally made for the commercial version of the FT-50R, the VERTEX series. The case has a commercial belt clip, stretchable elastic on both sides, and a clear front will holes cut out for the speaker and microphone. The thing I fear most is damage of the clear display, and the plastic covers that nicely. Since the sides are elastic, the case accomodates the low power battery as well as the 9.6 volt battery.

I also have a custom case made by a local couple in town who are police officers. Problem is, most of the Motorola HTs have all controls on the top, and you can change the controls while they are in the case. Not so with the FT-50R. The case I mentioned above is the one I use. It easily slips off the belt for programming, and secure on the belt when you place it there. I am unsure of the model number, but I know AES has them for about $20.

Hope this helps! I know there is a heavy leather case out there also, but I like to be semi-inconspicuous!

From: jch.nv@rocketmail.com
Subject: AC Linr Freq. Meter

Thanks to all that read this posting.
I am looking for information on how to construct a line frequency meter for the purpose of monitoring the output and aligmnent of generators. I would like it to be able to provide a linear voltage to indicate frequency at 110VAC. A generating set that is used at a local repeater site (10kw Kohler) has a standard needle type meter that reads out from 45 to 65 cycles. I have a vibrating reed type meter at this time, but would like to constructy a meter that can be permantly attached to the generator (I have mort that one genset). I know there can't be much to the circuit, but I don't know
where to start. (The simpler the better, less chance for trouble) Please respond via e-mail if possible.

Thanks & 73,
Josh KD6KML

Subject: CABLE TV--FREE DECODER PLANS--

Now you can get new plans to build a Cable Descrambler System, US and UK plans.

This is not the origonal Radio Shack plan (now obsolete), but a choice of six new up to date plans designed to work on any cable box in any area. Just send me details of which cable box you have and in what area you reside as the plan needed will vary area to area, and you will be able to view all premium and pay per view channels.

It works on all Cable Tv Systems. The parts to make the box cost appoximately $15 (depending on the plan) and you can find them at any local electronic part supplier(US Residents will be supplied with radio shack part numbers). British Sky Cable descrablers cost approx 20 Pounds. Remember this is for educational purposes only, you still have to pay for the channels you view. I have to say that to protect myself for any liablity.

For the Plans just send $ 2 or 2 Pounds to:

Ed Hacker
409 Adams Street # 7
Hoboken, NJ 07030
USA

The reason I charge two dollars is for the stamp, envelop, and paper your plans are on. I am doing this for you not for me to make money. Lets get real you cant buy much for two bucks. I am not in this for the money but to get back at the cable companys that over charge people.

CABLE HANDBOOK (Additional $2)

Everything you ever wanted to know about cable boxes. Includes a cross reference list for upgrading your box using upgrade converts, cubes, plug-in activators and service code-generators. Also explains general cable operation, this handbook is very COMPLETE, a must have!

TURN ME ON!

Turn on all your premium channels with nothing to buy.

The Notch Filter

A notch filter allows you to selectively descramble channels. For instance, if HBO is on channel 7 and Cinemax is on channel 14 or pay-per-view is on 22, you may build a notch filter to descramble each of those channels. This method is fairly simple to build; However, it requires several more parts than the Fifteen Dollar Box. This system will work on your cable system, no

matter what frequency your cable system operates on. A cable box is NOT REQUIRED, and parts cost in the range of $25-30 depending on how many channels pay channels you wish to descramble. NOTE: I used channel 7,14 and 22 as an example. Your premium services may be on other channels and the notch filter can be built for whatever channel your premium services are on. (between the range of 2-22) Parts can be purchased from a electronics wholesaler/retailer in your phone.

The Gated Sync is the Grand Daddy of descramblers (in band and out band). It can be configured to operate on your cable systems frequency. This system is for the serious home electronics buff. It is a bit more complex to build; However, it sells for a lot of money. And, it will descramble EVERY channel.

SSAVI was created by Zenith, and used by many Zenith converters. The system is very difficult to build, but it will descramble EVERY channel, and also sells for a lot of money. Novices should not attempt to build the SSAVI system.

FREQUENTLY ASKED QUESTIONS

What is a Descrambler?

A descrambler is a device that restores the picture and sound of a scrambled channel. In most cases, ALL channels which are scrambled will be restored.

Are Descramblers legal?

YES! It is legal to build, sell, ship, use, and own a descrambler; However, when you use a descrambler, it is your responsibility to notify the cable company that you are accessing their signal.

Do I need a converter from my cable company?

In most cases NO. A cable ready VCR or TV will work.

Is it difficult to build a descrambler?

Turn me on, the Fifteen Dollar Box, the Oak converter and the Foil method are very simple methods! The instructions provide step by step instructions. No special skill or knowledge are needed. The Notch filter is still fairly simple. The Gated Sync is not for the beginner, it requires electronics knowledge.

Can I build more than one?

YES! You may build as many descramblers as you want! They are legal to sell and demand fairly high prices!

Just send me details of which cable box you have and in what area you reside as the plan needed will vary area to area
For the Plans just send $ 2 or 2 Pounds to:

Just purchased the Icom 2350H and managed to handle "all" functions except when it came to putting
the radio in crossband repeat, which is the reason I bought the radio in the first place. The manual
Icom included with the radio barely mentioned this feature! I do data input and work from 11PM till 7AM
and really need to get this function working so I can talk with my friends through the night. If you can
help please email me directly at pentode@sundial.net. I've not been able to contact Icom regarding this.
Thanks, Tom Haley KC4ZVM IN Orlando, Florida.

1205. looking for commercial xband (1 way) link between two radios

Before the days of Dual-band radios (Yes, I'm older than dirt...)
I remember seeing ads for a patch between a 2m and a 440
radio that would allow the combination to be used as a
xband repeater, at least in one direction. Are these still
available? I'd rather buy than build the mic/spkr/vox
combo if I can (hardware hates me!).

Source record: 170493

Everyone I know who bought the radio was happy with it. I've tried one,and am also thinking of purchasing one. The only difference on the HP model is the 12v
battery. Early versions of the radio could be expanded TX and RX to very wide capabilities, with only a keypad sequence. ADI also made this radio for Radio Shack, but it was quickly pulled from the shelves when they got wind of the easy keypad mod. On the current firmware version a hardware mod. easy does the same trick. I like that the mod. gives you 800Mhz receive. I need it because all my local police are on 800mhz, and I could use it for ham and as a scanner rcvr. the new firmware version (early July) will restore much of the keypad mod. of the early version of this radio. I learned this from a web site devoted to ADI mods. It covers all the ADI rigs. Gotta love that wide band receive! If you want the website i'll try to dig it up and post it.

Sending my new VX-1R back to Yaesu.

The CTCSS Tone squelch, DCS, or Tone can not be activated
in the two bands 170-222Mhz("VHF TV")
AND 470-800mHZ("UHF TV)".
The radio can activated Tone, Tone Squelch, DCS in all the
other bands.
Trying to listening to our Fire Dept, and other Systems
that use Tone Squelch, get some Intermod, so must need
Tone Squelch on receive to use in my area.
Anyone else notice this, why can't Yaesu fix the firmware
flaws, before releasing a radio.
If Yaesu can't fix, I returning it to the retailer!!

I hope others will notice and call Yaesu to fix this asap
in their firmware, 5 other hams with the new VX1R noticed
this and were upset that it seems these Radio manufacturers
release 1st generation radio's with bugs.

It's funny in less than 1 hour, I find a bug, don't they
(Yaesu) ring out their radio's for bugs!!!

Mike

Heathkit Radios for sale!

I have four (4) radios for sale. Two are close to
working, 2 I havn't been able to get anything to happen.

SB-101 All tubes. Cosmetically good. 400 kc CW filter.

SB-101 All tubes. Very clean. 400 kc CW filter
Some audio & Receive. No Xmit.
I think this one just needs a good tune-up.

HW-101 All tubes. Very clean. 400 kc CW filter.
Receives but need tuning.
Transmits but needs tuning.
This may be the best one of the bunch.

HW-101 Most tubes. Seen better days. No filter
Havn't even tried to get this one going.

One HP-23 and Two HP23A power supplies.

Box of spare LMO's, feet, dial parts, tubes, etc.

I'm selling all of above as package for $100.00 plus
shipping. The CW filters I know alone have been going
for $40-$50 each on the used market.

If intrested, please contact Shane, WB2WPM at:

(716) 675-5797
or sbrady@pce.net
or wb2wpm @ke2vw.#wny.ny.usa.na

I'm located outside of Buffalo, New York.

If your a fixer-upper and good with tubes radio's I
know you'll be able to get 2 of these up and running
in no time. The other 2 maybe too.

Thanks for reading, and hope to hear from you.

73, Shane WB2WPM

Did I miss something, or is Burt Fisher a hero?
Why haven't I heard of him outside of this newsgroup?

I've never hear anyone, or anything, receive so much
attention on a newsgroup. He must be a very, very
important fellow to receive so much attention from you
guys. If there's something not to like about Burt, ignore
him. He has all you folks wrapped around his finger.
He says something, and about fifty of you have
to get your digs in. Heck, even if I were so unpopular,
I'd probably string some folks out like that, too, if it's so
entertaining to do so.

Mike

AMEN Mike... You can also include a couple of other guys as well... I've
noticed a lot of love letters going back and forth centered around posts
made by James O'Brien and some guy called Masa. I've had enough of this
crap and I sure wish they would respond outside of the group so we can talk
about Ham Radio!! That IS what this group is for. My server and
connections to the outside world are slow enough without having to download
useless gibberish from people like them.

Maybe we can post an official boycott listing so people here won't post
replies to these guys. What do ya think??

Paul
KL0AN

P.S. I posted my call sign because that seems to be one of their favorite
gripes.
Hopefully it's in whatever call sign search program they use so they won't
flame me for using a bogus call sign.

What did you own before purchasing the 920? I'm thinking of buying a 920
and was wondering if the receive audio is as good as the 990. Also is
the DSP in the audio stage or the IF..TNX Dennis n1kcl@worldnet.att.net.

I am interested in purchasing all kinds of compressor/ amplifiers, older microphones, mic preamps,mic mixers and other professional broadcast and recording equipment for my collection and recording studio.

Loking for Turner model 77 and 87 microphones, Sennheiser model 409 mics

Brands such as Neumann, AKG, Telefunken, UREI, Teletronix, Altec etc.

Especially interested in anything by Langevin and RCA.

The older the better, and basket cases are always welcome.

Thanks in advance.

I can't understand why the manufacturers don't have a team of Hams try the radio out to "DEBUG IT". It seems that anyone who buys a new Ham Radio when it is released is the "ALFA TESTER" without knowing it. He also is paying top $$$$ to be the first guy on the block to get the radio.

There are two types of people in this world:
1. Those that must be the "first on the block" to have a new product,
and
2. Those that wait a while to let the experiences of #1 work the bugs
out of product.

True of ham gear, cars, etc.

greetings,

i have performed two mods to my 2350h that involve d8 , d9 and w1
jumper .
according to my service info sheet there are two MORE mods which can be
done by (i assume) removing two more diodes . i have done this but the rig
acts no different than before . the service sheet has a couple of lines
blacked
out so i can't read them . does anyone know the function of these
additional
mods ? do i need to do some 'magic' keystrokes on the front panel to
activate them ?

thanks in advance

Mike, are you using Yaesu manufacured pugs and cables? If not, you're
probably shorting the PTT line to ground.

>Any info on the FT-530 vs the FT-50 will be appreciated

Jeff,

Two totally different radios. The FT-530 is a "true" dual band radio...in
that it is capable of full-duplex and simultaneous receive on both of two
receivers. The FT-50 is a "twin" band radio..thus capable of receiving
only one frequency at a time of different bands. No full duplex etc.
Both are very impressive radios in their own rights but I could not
compare one to the other without taking into consideration each is in a
class by itself.

> other bands.

That sounds perfectly reasonable, since those tone squelch
systems are not used on VHF TV or UHF TV ... now, to be fair
there may be some 470-512 Land Mobile stuff in your area, if
you're in one of the major urban areas, but you're not supposed
to be transmitting in any of those bands (even if you're licensed
in another service) since Yaesu's radio is not "type accepted"
for the commercial services ...

> Trying to listening to our Fire Dept, and other Systems
> that use Tone Squelch, get some Intermod, so must need
> Tone Squelch on receive to use in my area.

Tone squelch will not make the intermod go away ...

> Anyone else notice this, why can't Yaesu fix the firmware
> flaws, before releasing a radio.

Doesn't sound like a "flaw" to me ... sounds like they intended
it that way ...

> If Yaesu can't fix, I returning it to the retailer!!

Good luck finding a scanner that will cover those bands that
will support those tone squelch systems ...

> I hope others will notice and call Yaesu to fix this asap
> in their firmware, 5 other hams with the new VX1R noticed
> this and were upset that it seems these Radio manufacturers
> release 1st generation radio's with bugs.
>

> (Yaesu) ring out their radio's for bugs!!!
>
> Mike

Again ... while I understand that you think the radio should do
something it apparently doesn't, that doesn't necessarily make

it a "bug" or a "design flaw" ... it seems perfectly reasonable to
assume that Yaesu never intended that tone squelch function
in the 170-222 and 470-800 MHz bands, since it's hardly ever
used there and you're only supposed to be listening there anyway.

Folks,

I bought a Hy Gain Hy-Quad antenna, new in the box, at a Hamfest this weekend. This is the 10m-15m-20m quad, marked with order number 244. Anyone ever use one of these? Although the antenna was new, the manual was missing out of the box. Monday, I'll call Hy Gain, but if anyone has a manual laying around, I'd like to know. If Hy Gain discontinued the antenna a long time ago, they may not have any documentation for it.

Thanks for your help,

73

Yes. That works.

:Funny that that was not in the manual! The only way I could delete
:channels before was to use the ADMS software.

The manual is far from complete. The manual leaves out a step for
clearing the DTMF decode memory. You must press the f key for 1/2
second then the knob for 1/2 second. You can use auto record just
by pressing f followed by the record button.

Turn on the radio
Setup both bands the way you desire
Press and hold both main band buttons and set button all at the same
time until the memory channels are a flashing " L " . The radio is
now in crossband repeater.
Press and hold the set button to revert to normal.

>
The receiver offset is about 800 Hz. I " zero beat " by merely
adjusting the s-meter to highest reading on the received signal. Once
set up a 735 and a service monitor. set the service monitor to 14.100
MHz and started generation. Tuned the 735 to " zero beat ", no tone
in the speaker, transmitted and found the 735 to be setting at
14.100. Could not be any easier if you bought it at Sears.

So if you peak the received signal you will be " zero beat " All
ICOM's react this way also.

Actually the "HOME" channel can be changed. I have changed mine to
146.52 and 446.00 respectively. You just have to make the "PRI" channel
another memory channel FIRST, as the "PRI" channel cannot be changed.

Hi all,

I have now added a QRP linear amplifier to the collection. It was designed as the final stage for my Phasing-type SSB exciter, but with over 30dB of gain it will make a lovely CW / SSB transmitter when used with a simple oscillator / driver. I have used it at 10 watts with my Grid Dip Oscillator (GDO) as a driver.

The hand-drawn PCB foil pattern is also included as a GIF file (drawn before I ever had a PC computer).

I am adding more circuits to my homepage constantly, as long as
I have time available to do it. Have fun with QRP (and QRO).
Harry, SM0VPO (G4VVJ), Upplands V&#65533;sby, Sweden.

I didn't see where the gentleman ever stated that he wanted "to transmit" anywhere. In fact, he clearly indicates that he wants to use the radio to receive. In many parts of the Country, and in other parts of the world, the 470-520 band is heavily used.

Secondly, the same goes for the 170-174 portion of the "VHF-TV" band. US Government uses a lot of spectrum in that 4 Mhz.

CTCSS and DCS is common in all of the operations. And yes, PL/DPL does not eliminate intermod, but, it most certainly does eliminate most of the noise coming out of the speaker that is associated with it.

The radio, however cute, has flaws. The radio is advertised with features it simply does not have. The FT50 was originally advertised as capable of wide band FM for broadcast reception, which was hardly even half true. The VX-1 is advertised as being 1 watt with the external power adapter, yet the "errata" sheet that comes with the manual says:

"However, transmission in this configuration may result in some amount of extraneous hum and noise being transmitted... we recommend that you transmit...only in an emergency." Can you find this little minor confession in the radios advertisements?? No you can't, this is one of them little flaws Yaesu is so proud of hiding and hoping that it won't be found out. Also, has anyone yet figured out the "290" memory channel BS?

If you want a 1/2 watt radio that transmits and receives in the 2 meter band and part of the UHF ham bands, then you came to the right place. Anything else may be vaporware and should not be considered a plus prior to purchasing until you have determined the actual abilities of the radio.

Tom

Tone Sqeulch in receive mode is really handy when listening in
the GRMS bands, common services use the same CTCSS tone.
I listen to the Forest Service Repeaters on 171.575, during
fire season, which all tx out a PL of 103.5Hz for protected receive,
Also in Mexico is a taxi service that I
hear, If I put my FT-50R, in Tone Squelch ,I don't hear that
a Taxi Cab Repeater in Mexico blasting in across the boarder.

Also , the SAVE mode for power savings will not work while in
170-222Mhz Region (VHF-TV) and 470-800Mhz (UHF-TV).

Here, in the USA there is more than TV stations in this Frequency range!!

Anyway, the Tone, Tone Squelch , and DCS for receive don't work
in the two bands above.

Yaesu shut off the Tone , Tone Squelch, DCS, and power Battery saving
modes in BC BAND, but does not make any sense for these two bands,
when it works fine for other out of band receive.

I would not want sloppy software work, so why should you when you
pay for it and they don't deliver.

It is the same as the problem as the advertized DVR on the FT-50R
when it came out, was a joke.

A year or so ago I purchased a bencher paddle and the econo box
keyer from MFJ. Time has passed, and I have lost the instructions on
how to connect the two. Can someone please give me instructions?

There are three connectors on the bottom of the bencher. One for each
paddle, and one for the post which the spring runs around.

The MFJ box accepts the 1/4" phone plug from the paddle.

Do I need a stereo plug to attach the paddle to the keyer? And is the left
paddle for the dit or the dah?

thanks,
robert ellis

Phil,
The guys at Yaesu read this stuff, so if you ever want an
updated firmware to get a radio they advertize does this and that,
you got to hold them to it!

That is why Icom fixed all the bugs in the Icom 706 and came out
with the Icom 706 Mark II.

If your willing to accept bugs and not voice it back to the
manufacturer, then odds are they will always sell radio's with
problems and never resolve them!!

1248. WTB:Crystals for HF Rig

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-13 00:00:00 UTC
From: Don Gray <lbol@panther.uwo.ca>
Message-ID: <01bc8fc4$2c0c5920$0100a8c0@don>
Source record: 170534
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.swap

Hi and thanks for reading this.

I have a crystal controlled HF rig that I'd like to get into operation. It will operate on the 80 & 40 M ham bands and frequencies outside them from about 2 to 10 MHz. The crystal frequency is the desried carrier frequency plus 10.7 Mhz. The crystal size is the miniature plug in type, the same size as was found in most scanners and HTs etc. before things got synthesized. By the way, if anyone knows the proper desgination for this size of crystal please let me know.

I'd like to get an assortment for 80 and 40 (CW and phone) and as well, I'd be interested in crystals that would give me receive on some common SW frequencies (i.e. WWV, CHU, BBC VOA). So I'm basically looking for crystals between 14.033 MHZ (CHU at 3.333+10.7) and 20.7 MHZ (WWV at 10.00+10.7). In between that range I'm mostly interested in crystals from 14.2 Mhz to 14.7 Mhz (80M) and 17.7 Mhz to 18 Mhz (40M)

If you've got something that fits into the above frequencies and is in the size of holder I'm looking for, please send me an email describing the crystal frequency(s) and how much you're asking for it (them).

Thanks,

Don

This same train of though is common when discussing antennas.

"I worked 17 countries in two hours. It must be the best antenna made."

No......The old A/B test is the only way to compare antennas or rigs. If I had not compared the 570 with an Omni, I too would love it. After all, it does almost everything for only $1500. That's a bargin these days.

Enjoy the TS-570d and don't pay any attention to us fussbudgets. Just don't ask me to copy 50wpm cw through heavy qrn with one.

Source record: 170291

I have for sale, a Ranger RCI-2970 100W All Mode 10m transceiver. It covers the entire 10m band, and *only* the 10m band.

I've had the unit for about 8 months, but for seven of those months it's been sitting in its box. It has about six hours of on-air time, and has never been abused or mistreated. It's in *pristine* condition, and works really well, when the band is open. The RCI-2970 is a great little unit for a Technician Plus who wants to work HF, but doesn't want to spend thousands of dollars on a radio.

I'm selling it because I bought an ICOM 706 a few months back.

Price? $300. I'll pay UPS shipping to anywhere in the continental US. Please contact me via email if you're interested.

I have a 756 and like it very well. I can find nothing that displeases me about the rig.
It by no means exceeds or equals my 781; However I have owned an 870 and have
operated a 920 and personally like the 756 better. I won't go into the technical side because most hams these days simply like the way a radio looks and ease of operation. What a shame.

Source record: 170298

I am having problems with a gap titan DX. It is up on a 20ft tower. with an MFJ ant anlyzer at the pigtail the swr is over 4:1 everwhere. with a length on coax the swr comes down but I get TVI on the TV,Phone, the next door neighbors TV phone.
I can put up a dipole tited to the top of the tower to the ground (sloper) and have no TVI or RFI at all. I have tryed a 12v second rig on the ant also.
Has anyone had the problem? Any Ideas on a fix?

Email: adamscr@ham.muohio.edu

I sent one to them 6 weeks ago regarding the defective FT50s that they are knowingly selling, still no answer. Today I called and asked a "Technician" where the 290 memory channels were in the new VX-1 as advertised on their web page, and printed on the box the radios come in. He said that was probably a "miss-print". No, it is simply "false and deceptive" advertising, and it is a cornerstone of Yaesu marketing. You should have seen how quick the sales department booted me to Tech support. They didn't wan't to explain all the false and deceptive ads regarding this little bundle of errors. There are other manufacturers!

There was a small daughterboard installed in the t21 that allowed 800
mHz rx. I called icom a while back to see if this board could be
retrofitted to a t41. No dice. Apparently there was some incompatibility
in I.F.s'. The radios (t21 and t41) both probably use the same
u-processor and have the same firmware, diode matrix selectable model
and such(a moderately educated guess). 73, Will, N1PXA

... true, and remember the body tissues do not bear too much absorbed energy. This is another hint to magnetic coupling. High energy HF can cause severe damages - remeber the cellular phone debate. Remeber what your microwave oven does to your food!

Actually, pacers are self-powered, only the control can be taken from external devices. Frequencies form some kHz on do nort stimulate muscle and nerve tissue (I thimk, there is a book by an author named Katz dealing with these basic elements of physiology very well).

Hope, my annotations did help, too.

Yours
Peter

Tone Sqeulch in receive mode is really handy when listening in
the GRMS bands, common services use the same CTCSS tone.
I listen to the Forest Service Repeaters on 171.575, during
fire season, which all tx out a PL of 103.5Hz for protected receive,
Also in Mexico is a taxi service that I
hear, If I put my FT-50R, in Tone Squelch ,I don't hear that
a Taxi Cab Repeater in Mexico blasting in across the boarder.

Also , the SAVE mode for power savings will not work while in
170-222Mhz Region (VHF-TV) and 470-800Mhz (UHF-TV).

Here, in the USA there is more than TV stations in this Frequency
range!!

Anyway, the Tone, Tone Squelch , and DCS for receive don't work
in the two bands above.

Yaesu shut off the Tone , Tone Squelch, DCS, and power Battery saving
modes in BC BAND, but does not make any sense for these two bands,
when it works fine for other out of band receive.

I would not want sloppy software work, so why should you when you
pay for it and they don't deliver.

It is the same as the problem as the advertized DVR on the FT-50R
when it came out, was a joke.

Hi Again John.

As I had mentioned, I was able to program a custom repeater split into the FT-50R that allowed the radio to receive on 146.52 and transmit on 446.00. The unit will not cross-band repeat but will transmit/receive on separate bands.

It does not do duplex operations, i.e. it does not continue to receive on one band while it is transmitting on the other!

From: folaughlin@aol.com (FOlaughlin)
Subject: crossband

Hi Jim,
The FT-5100 is capable of full duplex crossband. You can set it so
when it receives a signal on one band,it re-transmits it on the other,and
vice-versa. No mod is required to do this. It is explained in fair detail
in the Yeasu manual. My friend has that rig,and it works great. It also has dual in-band receive for monitoring two 2mter freqs. or two 440 freqs.
simult. I have the 8100R and it also has these features,plus ext. rec. I think you will be very happy with it. Hope you get a good deal on the radio

OOPS- it is listed as the CT-44 in the VX-1R's owners manual. Sorry
about the confusion.

I have interfaced my Magellan 3000 with an XPLORER unit from
OPTOELECTRONICS. With the POWER/DATA module, you should be able to
connect the 3 wires to a DB-9 connector, and connect that to a Comm Port
of your computer. There is a DATA OUT, DATA IN, and GROUND. You would
then need the appropriate software to download the data.

I am unfamiliar with navigation software, as I am not a boater. There
must be some info on the internet.

>etc.) is not a problem.

All you need is a SINAD meter and a signal generator. I use an IFR1200
which combines both in one unit. Connect the SINAD meter to the radio.
Connect the signal generator to a reference antenna. Now with the
computer
turned off, generate a signal and adjust the level to achieve a 12 db
SINAD
reading from the radio under test. Note the dbm level of the signal
generator.
Now turn the computer on. Readjust the signal generator to return the
SINAD
reading to 12 db. The difference in signal generator levels between
computer
on and computer off is the amount of desense you are suffering.

Note don't move the radio or the antennas during this test, and try to
keep
your body in the same position so that you don't change the relative
near
field relationships while doing the measurement.

Subject: TS-570 vs Omni V

Steve,

I can only conclude you did not have a good TS-570D sample or did not
use the NR2 position on CW.

I am a fairly "serious" (since 1953) CW operator who has had a 570D
since they were released, as is one of my friends who has a 570D. We

both love it. I also have an NIR-12 by JPS. NR1 on SSB in 570D is inferior to JPS-NIR-12; NR2 on CW does as well or better than NIR-12.

Re "true" DSP: True DSP shold be ahead of the AGC stages. In that sense most of the audio stage DSPs are not "true" DSP. None of the outboard units (JPS, MFJ, Timewave) are likely to meet the "true" DSP definition -- but that does not meaan they are ineffective.

My big pain is those rigs (TS-870 is one example, maybe the only one) who put IF stage DSP at a low (15-20 kHZ) freq IF and then do not alow for a xtal/mech filter at RF IF stage: Those rigs can have a real problem!

BTW: I have not compared TS-570D with Omni or many other rigs. Others have and have given positive reviews. But on CW it beats the socks of my old TS-440S with JPS NIR-12 and narrow CW filter! But you must use the NR2 option; NR1 is not helpful for CW and NR2 distorts on SSB. It also helps to narrow the DSP BW for CW with NR2 (it can go as low as 50 Hz, and the sigs really pop out of the noise on my 570D -- but not with 600 Hz DSP BW).

Subject: TS-830 Freq Jump

I had a problem with my TS-830S jumping frequency (about 100 Hz at a time)and I got lots of replies when I asked for help. Ham radio is full of a bunch of really great folks - no wonder I love this hobby! For me,cleaning the FIX button worked (yes, the "FIX" button was broken ;-)). I'm posting this to thank everyone, and to help anyone else in the same situation. All the suggestions were excellent. Alan Wormser, N5LF (ex-WB5QLF)

>From Ian G3SEK, Art N2AH, Paul K0PW, Frank KB0ZFN, and many others:

Grounding the AF/AVR board: Connecting a wire from TPG post to ground screw, and inserting star washers between board and heat sink, In accordance with Kenwood bulletin - appeared in QST Hints & Kinks in the mid-1980s.

>From Dale R. Parfitt W4OP

Although I have not seen this problem in a Kenwood, I have seen it in Icom and Yaesu- both with the same cause- small single turn variable caps. In case of the Yaesu it was a frequency netting cap on a heterodyne
oscillator- drove me nuts. It occurred randomly and never when I had the rig open. A hint from another ham sent me looking in that direction. Replaced 2 or 3 and that was the end of it. Hope this helps.

>From Brian Sherrod KJ5AG

This is a common problem with the 830. This jack has a contact which
is
shorted WITHOUT a external VFO. If the contacts get dirty, it will do
exactly as you described. You might also want to spray a small amount
of
contact/electronic solvent on the jack and do the plug in and out as I
mentioned before.

>From Dennis Clemenson NT0V

NOTE: This solution is also in the 1997 edition of ARRL's book,"Hints
and
Kinks" I had what sounds like the same problem with a TS-830S.
Turned
out the switch labeled "FIX" was intermittent. It is in the path of
the
voltage to the VFO and if it has some extra resistance, the frequency
would change. I tried "Deoxit" and that worked for a while but finally
I
jumpered around the switch contact since I never used crystals for
operating. Try operating the switch many times and see if goes away for
a while.

>From John <rtwodtwo@jps.net>

Sounds like one of the xtal trimmer caps is going bad. The center
pivot
point is getting rusty. Contact cleaner will fix this for a month or so
but you need a new one.

1275. IC 706 front end BP filters

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-14 00:00:00 UTC
From: SIDDHARTHA BHATTACHARJEE <siddhart@delhi.cig.mot.com>
Message-ID: <33CA5770.177F@delhi.cig.mot.com>
Source record: 170311

Dear everybody,

I have an Icom IC706 with serial number 009793. I am very keen to know whether this radio's front end bandpass filters have been properly wired. Because I remember having read that some early models of the same radio had incorrect wiring of the filters. As such I have observed selectivity problem in the VHF band of the radio.

Can anyone help me please. I have the mods however, but scared to open the rig as it is so small.

Thanks a ton in anticipation.

When replying to this message, please send e-mail directly, BUT, you must first remove the *NOSPAN* from my e-mail address above. I'm tired of learning how to earn $50,000 in a month! :)

I need information on an Alliance HD-73. I bought one a couple weeks ago, but the previous owner was unablt to locate the paperwork. If you have a manual, I'd be glad to pay for a copy. But I really need to know a few things:

What is it worth? (Did I get ripped off?)

What are the specifications of the rotor?
Maximum weight, wind load, torque, etc.

I MAY be putting this thing under my HF antenna this weekend and would certainly appreciate it if I can avoid making a mistake.

Skip the PVC pipe -- UV radiation will turn it to dust in a couple'o
years.
Go to your local hardware dealer(s) and price top rail pipe use in chain
link fencing -- I think it can be had in 10', 15', and 20' lengths.
Pick the one you find with the best wall thickness...
I'm using one for my tri-bander/6mtr/2mtr installation.
And we use four (properly) cut 20 footers to put up a phased 2-element
40mtr verticle on Field Day. One end of the pipe is already necked down
for about 6" to enable it to slip into the next section.

1293. XPLORER/SCOUT CASES

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-14 00:00:00 UTC
From: "James F. Boehner, MD" <jboehner@scescape.net>
Message-ID: <33CA513C.3A73@scescape.net>
Source record: 170352
Cross-posted to: alt.radio.scanner,rec.radio.scanner,rec.radio.amateur.equipment

To All!

I posted a message about a week or so ago about a local couple who have started a business making custom cases for radio equipment. I loaned them my XPLORER and SCOUT to allow them to produce their products. I just received my order, and I am VERY pleased.

Both cases are made out of ballistic nylon (the same stuff that the bulletproof vests are made of!), and have a sturdy metal commercial belt clip. For the XPLORER, I asked that they put a thick clear membrane on the front to allow access to the display and the buttons. The POWER button is covered by the fabric, so there should not be accidental turn-ons/turn-offs. There are holes in the fabric to allow the speaker audio through. For the Scout, they placed the clear membrane on the front, and opened part of that membrane to allow access to the switches on the front panel. The display, and the button are covered by the membrane, however. I decided to remove the supplied belt clip of the SCOUT so that the case can be a bit more snug. The stiff back and the metal commercial belt clip are part of the case also.
I believe they are charging $30 for the XPLORER case and $28 for the Scout case.
They do not have a web page up yet, but their email address is:

themarketwild@scescape.net

I don't receive any part of the money. These people are police officers who do this work on the side. I am trying to make their service known for three reasons; 1)that OPTO has made no effort to market cases in which you can carry around and use their products. They only have the zippered pouch case and 2)My thanks to this couple for working with me through several revisions of the cases to ensure my satisfaction and 3)There must be people out there like me who are worried about damaging the cases to the degree that they don't want to take them out of the house!

Two things: The couple is not geared to mass production, and must hand make these cases. Be patient. The total time for both cases for me was 2-3 weeks, but that was through several revisions and your milage may vary. The couple will be going out of town for vacation for one to two weeks, and you will probably not get a reply for a week or so if you e-mail them.

>Nit

~~~~~~

I agree with these being two different radios. To answer the question of ruggedness - I have had an FT530 for four years and just had a first repair - the BNC connector to internal antenna connector became intermittent. I have travelled on multiple trips with this using it and a Diamond S7000 18" dual band as my easily packed mobile station. Since I am into public service listening as well, my 530 gets double duty. Unlike the FT50 though, the FT530 has no Digital Coded Squelch - you can have digital paging - where a 3 digit DTMF code will break squelch, but not true DCS.

> >suggestions?

1. Dismantle the radio and push the power button out.
2. Cut about 1/8" off of the end you touch.
3. Put it all back together.

It's a little ugly, but it does work great. You could try to get a little
fancier and try to cut 1/8" out of the middle and glue the parts together
so that you still have the lettering on the tip, but I wouldn't. I hated
to do it to my shiny new radio, but after a couple months and some
scratches,
it was worth it just to keep the damn thing from toggling off and on at the
wrong times.

1301. Need help making chokes

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-14 00:00:00 UTC
From: voicebox@dnai.com
Message-ID: <voicebox-1407971141510001@dnai-207-33-180-161.dialup.dnai.com>
Source record: 170360
Cross-posted to: rec.radio.amateur,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I need help making a couple of 2mH air-core chokes. This is for an experiment with audio frequencies and currents, so I need to make them out of stout wire (probably 14ga solid copper, insulated). They need to be somewhat adjustable by hand (spreading out the coils).

Can someone give me some dimension guidelines for these? It will be easy to know when they are tuned (waveform on the o'scope will peak, so say the instructions), so great accuracy isn't required.

I am a non-radio electronics amateur who knows the consequences of breaking ohms law :-)

Any help will be greatly appreciated. Direct e-mail replies, doubly so.

Thanks.

Enjoy,
Dave

1302. Re: FT-50 Antenna News

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-14 00:00:00 UTC
From: VKHD16A@prodigy.com
Message-ID: <5qdrsk$2j0a$1@newssvr02-int.news.prodigy.com>
Source record: 170361

Have used the SMA to BNC adaptor for 10 months with no problems. (also have a SMA to 259 adaptor, both for under $4 at a swap meet). It allows the use of many antennas, the best duckie being the MFJ 1717 dual band. Adaptor and antenna look ugly, but so what, the rig itself is ugly-- but works great.

Steve

>Ok
>

>Has anyone gotten the ADMS-1C to work with the YAESU FT-51R?
>

Yes, I tried to use the ADMS-1C with the FT-51R ... but the reseults
was not very exciting.

I had no problem with the template creation, upload from the radio,
data entry etc. etc.
The problem arised when I tried to download TO the radio!

Only one serial port of one of my computers succeded. It's an HP-25451
(or something like this) double com port RS232 and 422 compatible.

All the other trials I made got the same "Clone Err" at the begenning
of the down load.

I sent a fax to RTS, but after two months ... NO REPLAY.

<33C78C46.6B21@ix.netcom.com>...
> When my unit is already turned on and I insert a audio jack or computer
> interface unit starts to transmit automaticly.

If you insert a four conductor (the special Yaesu one) plug,
you will short the mic connector momentarily and cause the
radio to transmit (unless you do it really fast), but it
shouldn't be stuck in transmit.

If you insert a two or three conductor plug (like regular
Walkman-style headphones), you will short the mic connector
continuously and the radio will keep transmitting. But for
some reason, if you power up the radio in this state, it seems
to be smart enough to shut off the transmit.

If you aren't using the Yaesu-style plug, get one. The best sources
I've found are the speaker-microphone adapter and the cloning cable
(which is just two connectors wired together).

1308. Icom T41 extended receive performance?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-14 00:00:00 UTC
From: NewsRadio <jmckay@interlog.com>
Message-ID: <33CA8BAF.50449E37@interlog.com>
Source record: 170367

I have an Icom T41 UHF ht I just bought used . It seems to work
very well. I would like to hear from others about the follwing
performance questions that I have:
1. Receive in the extended VHF band is slightly less sensitive than a
typical VHF hand held (eg at 162 on the weather frequencies). I'm
assuming this is due to the small antenna?
2. I can enter 800 meg frequencies but can't receive signals that are on
the same frequency that are picked up by the scanner or other radios..is
there a mod for this or is the sensitivity just poor on 800?

Source record: 170368

Hello All;
I am selling the Kenwood TS-440SAT with the optional PS-50 power
supply and optional Kenwood MC-60 amplified desk mic. All has less
then 5hours of use. I'm the 2nd owner. The 1st owner purchased this
unit not knowing about his qth's restrictions on no outside antenna
laws. Both of us are non-smokers..
Also all original paperwork, cartons, user's manual, covers
for the 440 & PS-50 & optional service manual are included. I have
the MFJ-1272BX tnc-microphone switchbox also if interested..
Asking $750 for TS-440SAT with both manuals, paperwork
cover & original carton. This unit has the auto
antenna tuner, been modified for "MARS" and the
optional 7 digit LED read out. Has 100 memories
plus much more.. We detail if interested
Asking $175 for PS-50 with cover and original carton
Asking $85 for Kenwood MC-60 desk mike
Asking $980.00 + shipping. For all the above Or Best Offer.
This is a must see hf setup and I would prefer any potential buyer
to see all the above before buying.. This is One Great Setup..
Reason for selling is strictly financial. Please re:me either through
Packet: N2RIF@WM2F.#SNJ.NJ.USA.NA
Or Better
Email: n2rif@amsat.org
My phone# is: (609) 386-9382 but sorry it is busy most of the time.
You can try though anytime from 10am to 10pm ET..
Thank you for reading my sale's bulletin.

1313. FT-50 Antenna news +5db gain!

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-14 00:00:00 UTC
From: RonL-nospam-@macconnect.com
Message-ID: <5qdtok$2o5@drn.zippo.com>
Source record: 170372

According to the friendly folks at Comet, the native FT-50 antenna is already -5 from unity. Their SMA-503 8" wire antenna is unity so it effectively gives you +5db. Their SMA3 10" stiff antenna gives you an add'l 1.2/1.7 db which in my mind in't all that much for putting up with a stuffie.

1323. Standard 510; crossband repeat?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-14 00:00:00 UTC
From: jeff <jefco@got.net>
Message-ID: <33CAA0D5.80218007@got.net>
Source record: 170382

The ad in the HRO catalog says the 510 can "store 2 bands in 1 memory for crossband operations." Does this mean it actually has a crossband repeat function, or that it just transmits on one band while listening on the other? I'm assuming the latter, but thought I'd see what the actual users say...

Having purchased a 756 and having spent more than 1.333 hours using it I
must
say that I have never seen "the display go amiss", whatever that means.
It is
not slow, as implied in the previous post, and accurately represent the
freq at
any instant. It is also a crisp and clear display when adjusted
appropriately
at least for anyone not visually impared ;-).

> the quality on the dual recieve i didn't like and the general spec analyzer i
> didn't think was good at all [mind it's not a 781] . I found the 920 the dsp

I think it would be nice if they would allow the spectrum analyser gain
or sensitivity to be set by the user or better yet have a memorized
setting for
each band.

> was ok but lacked a li'l as far as cw eliminating the hash on cw mind you would

> extra filters for the 756 and the board and filters for the 920 it more than
> equeled the extra features of the 870 re: no filters to buy for the 870 .

Some people buy the filters to fill out the rig and have more buttons to
play
with, I find rare use for the type and bands of operation I do so, this
may
or may not be a relevant factor for you. I seriously doubt that anyone
can
put the DSP in either the 920 or 756 to a serious test in 1.333 hours of
fiddling.
I am quite pleased with the dual passband tuning, notch and noise
reduction in
the 756 with its IF DSP.

> just my personal findings i hope that this has helped you for things to look

Source record: 170385

I got my 756 today and I'm confused about the filter setup. The review in May QST implied you could install filters for CW or SSB but not both. I operate CW most so I would opt for a set of CW filters. But could you put a SSB filter in the 9MHz IF and a CW filter in the 455kHz IF?

The manual isn't much help on this.

Pat, K0PC

1330. Morse Code in Music: New Oasis Song

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-14 00:00:00 UTC
From: Shawnerz@xSprintmail.com
Message-ID: <33c96da3.1131674@nntp.a001.sprintmail.com>
Source record: 170403

This is a little bit off the subject, but here goes. About 2 years ago when the packet network was at it's peak, there was a post in regard to morse code in music. It was batted around the country and people added Kate Bush, Roger Waters (Radio Kaos) and other artists. I thought of the post this passed week as I heard the new Oasis single, "Right here, Right Now" or something close to that. There are some tones at the beginning and the end of the song that are supposed to sound like morse code. It isn't. You can tell it was what somebody thought Morse code *should* sound like. There were some random "S's", "A's", "E's", and "T's" but no words. I thought it would be neat to send "OASIS" over and over again, but they didn't ask me....
You know, if you're an artist and want to and Morse code in your music, I'm sure there are hundreds of hams that would love to do it!

AAhhhhhh, I can imagine it now...the recording sessions, the concert tours, the groupies!!!
The conversation would probably go like this:

Me: "Hey, you know, I'm in the band."

Groupie:"Oh yeah, what do you play?"

Me: "Well, I'm the Morse code operator?"

Groupie: "Oh, you were that geek on stage!"

On another semi-related thought, I remember seeing this movie one night where these people owned a tavern during World War II. The owner and the piano player were in the resistance movement. The piano was modified and one key was connected to a transmitter. The player would send morse code WHILE playing music while the Germans were drinking in the bar. Pretty wild, eh?

Thanks for reading a post that has little to do with amateur equipment.

-Shawn

1337. Can FT-50RD RX on one band and TX on the other?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-14 00:00:00 UTC
From: zucchini@ix.netcom.com
Message-ID: <33c98ac5.482126@nntp.ix.netcom.com>
Source record: 170410

Can the Yaesu FT-50RD receive on one band and transmit on the other? A salesman at the HRO in Virginia insists that it will not and that I would need a radio with 2 VFOs (like the FT-51) to do that. A couple of FT-50 owners disagree with the HRO salesman.

I want to be able to use a HT to transmit to a mobile (setup as a crossband repeater) which in turn transmits to the input frequency of a fixed repeater and receive the output frequency on the HT.

Thanks, John

1338. $$$$$ LOAN BUSINESS, EASY MONTHLY INCOME, NO BRAINER $$$$$$$

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-14 00:00:00 UTC
From: a19@a.a
Message-ID: <33c97bd6.0@news.unibe.ch>
Source record: 170411

I have participated in the standard "Please put me on your mailing list" letter and found it to be worth
my time (I get 1 or 2 handfulls or letters every day) but I also found that it's results were nowhere
near what I expected due mainly to people not sending in the money but rather spreading the letter
without paying for it. I participated in that mainly as an experiment and found that there are a
tremendous amount of people willing to do it. I thought about how to, first, eliminate the "non-pay"
problem and, second, to create a monthly income. I came upon the solution and decided to start a new
program. I decided that there were 3 things that this new program needed in order to work for everyone
and they were: 1.) It needed to be very simple and easy for anyone to do, and, 2.) It needed to be
inexpensive enough for even the poorest of people, and, 3.) It needs to be DUPLICATABLE. I think you
will find this program to meet those requirements. I have put lots of thought into it and I ask that you
PLEASE do NOT modify it. This WILL WORK if you follow it. This system is based on the unconditional
"loaning" of money to people. Simply say, "I am loaning you this $2 as an act of goodwill to help you in
your financial need, you may pay me back if and when you can." You should find 5 or more people who will
send $2 to the 5 needy people on this list AND MAINTAIN 5 or more people who will do the same. You
should put your name on postition number 5 and move each of the other names up one position. The name
originally on position number 1 gets removed. You should be able to contact each of your 5 or more
people to see if they are going to be active this month. If not then you need to find one or more people
to be active in order to maintain at least 5. I am not speaking about the 5 people on the list but
rather the 5 new people you have found. I would highly suggest having more than 5 in any given month.
Now I know that this would be extremely easy to do since I can think of at least 20 people myself who
will do this consistently. The key is to maintain at LEAST 5 active people. If you don't then you can't
expect for the rest of the people to do it either and you can't expect for this system to

work. This
system is a no-brainer, and if someone can't afford the $10 + stamps for this then they truly ARE in
need! It is OK to use the internet to find people but I think it would be easier to find them through
people that you know. This way it will be easier for you to contact them every month to ask about their
being active, unless someone is willing to give you their e-mail address. Here are some numbers:

Monthly income model per level and total for maintaining 4 active members @ $2 each:

Level 1: $2 x 4 people = $8, Total now $8
Level 2: $2 x 16 people = $32, Total now $8 + $32 = $40
Level 3: $2 x 64 people = $128, Total now $8 + $32 + $128 = $168
Level 4: $2 x 256 people = $512, Total now $8 + $32 + $128 + $512 = $680
Level 5: $2 x 1024 people = $2048, Total now $8 + $32 + $128 + $512 + $2048 = *** $2728 ***

Yearly income: $2728 x 12 months = $32,736

Monthly income model per level and total for maintaining 5 active members @ $2 each:

Level 1: $2 x 5 people = $10, Total now $10
Level 2: $2 x 25 people = $50, Total now $10 + $50 = $60
Level 3: $2 x 125 people = $250, Total now $10 + $50 + $250 = $310
Level 4: $2 x 500 people = $1000, Total now $10 + $50 + $250 + $1000 = $1310
Level 5: $2 x 2500 people = $5000, Total now $10 + $50 + $250 + $1000 + $5000 = *** $6310 ***

Yearly income: $6310 x 12 months = $75,720

Monthly income model per level and total for maintaining 6 active members @ $2 each:

Level 1: $2 x 6 people = $12, Total now $12
Level 2: $2 x 36 people = $72, Total now $12 + $72 = $84
Level 3: $2 x 216 people = $432, Total now $12 + $72 + $432 = $516
Level 4: $2 x 1296 people = $2592, Total now $12 + $72 + $432 + $2592 = $3108
Level 5: $2 x 7776 people = $15552, Total now $12 + $72 + $432 + $2592 + $15552 = *** $18660 ***

Yearly income: $18660 x 12 months = $223,920

Monthly income model per level and total for maintaining 7 active members @ $2 each:

Level 1: $2 x 7 people = $14, Total now $14
Level 2: $2 x 49 people = $98, Total now $14 + $98 = $112
Level 3: $2 x 343 people = $686, Total now $14 + $98 + $686 = $798
Level 4: $2 x 2401 people = $4802, Total now $14 + $98 + $686 + $4802 = $5600
Level 5: $2 x 16807 people = $33614, Total now $14 + $98 + $686 + $4802 + $33614 = ***

$39214 ***

Yearly income: $39214 x 12 months = $470,568

Keep in mind that it does not matter what day of the month that someone chooses to be active. It DOES
matter that they are active on that day EVERY month. The key to this is DUPLICATION! You must treat this
as a business. If you treat it like a hobby that is how it will treat you. You could even organize small
meetings with your people and their prospects and work with your leaders.
Think of how easy this would be for you, how reasonable this is, and of how good the chances are of it
working for you. You may need to hire someone to open all the envelopes.

NOTE: I decided on $2 instead of $1 because it is more feasible and it won't matter much for someone to
send $2 as opposed to $1. Also I was against $5 as that becomes too expensive to duplicate.

Mail $2 every month with a piece of paper saying "I am loaning you this $2 as an act of goodwill to help
you in your financial need, you may pay me back if and when you can" to the following needy people:

Garrette CX III with 4.5, 8 and 12 inch coils. Only the 8 inch coil
has been used. The machine only has about 50 hours
on it. Comes with case, instruction video, manuel, arm rest.
Everything works perfectly. I paid over $1100.00 for
everything. I would like $800.00 Or Berst Offer.

1340. $$$$ NEW SYSTEM, BETTER THAN "ADD ME TO YOUR MAILING LIST" $$$

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-14 00:00:00 UTC
From: a@a.a
Message-ID: <33c9aa41.0@news.unibe.ch>
Source record: 170413

I have participated in the standard "Please put me on your mailing list" letter and found it to be worth
my time (I get 1 or 2 handfulls or letters every day) but I also found that it's results were nowhere
near what I expected due mainly to people not sending in the money but rather spreading the letter
without paying for it. I participated in that mainly as an experiment and found that there are a
tremendous amount of people willing to do it. I thought about how to, first, eliminate the "non-pay"
problem and, second, to create a monthly income. I came upon the solution and decided to start a new
program. I decided that there were 3 things that this new program needed in order to work for everyone
and they were: 1.) It needed to be very simple and easy for anyone to do, and, 2.) It needed to be
inexpensive enough for even the poorest of people, and, 3.) It needs to be DUPLICATABLE. I think you
will find this program to meet those requirements. I have put lots of thought into it and I ask that you
PLEASE do NOT modify it. This WILL WORK if you follow it. This system is based on the unconditional
"loaning" of money to people. Simply say, "I am loaning you this $2 as an act of goodwill to help you in
your financial need, you may pay me back if and when you can." You should find 5 or more people who will
send $2 to the 5 needy people on this list AND MAINTAIN 5 or more people who will do the same. You
should put your name on postition number 5 and move each of the other names up one position. The name
originally on position number 1 gets removed. You should be able to contact each of your 5 or more
people to see if they are going to be active this month. If not then you need to find one or more people
to be active in order to maintain at least 5. I am not speaking about the 5 people on the list but
rather the 5 new people you have found. I would highly suggest having more than 5 in any given month.
Now I know that this would be extremely easy to do since I can think of at least 20 people myself who
will do this consistently. The key is to maintain at LEAST 5 active people. If you don't then you can't
expect for the rest of the people to do it either and you can't expect for this system to

work. This
system is a no-brainer, and if someone can't afford the $10 + stamps for this then they truly ARE in
need! It is OK to use the internet to find people but I think it would be easier to find them through
people that you know. This way it will be easier for you to contact them every month to ask about their
being active, unless someone is willing to give you their e-mail address. Here are some numbers:

Monthly income model per level and total for maintaining 4 active members @ $2 each:

Level 1: $2 x 4 people = $8, Total now $8
Level 2: $2 x 16 people = $32, Total now $8 + $32 = $40
Level 3: $2 x 64 people = $128, Total now $8 + $32 + $128 = $168
Level 4: $2 x 256 people = $512, Total now $8 + $32 + $128 + $512 = $680
Level 5: $2 x 1024 people = $2048, Total now $8 + $32 + $128 + $512 + $2048 = *** $2728 ***

Yearly income: $2728 x 12 months = $32,736

Monthly income model per level and total for maintaining 5 active members @ $2 each:

Level 1: $2 x 5 people = $10, Total now $10
Level 2: $2 x 25 people = $50, Total now $10 + $50 = $60
Level 3: $2 x 125 people = $250, Total now $10 + $50 + $250 = $310
Level 4: $2 x 500 people = $1000, Total now $10 + $50 + $250 + $1000 = $1310
Level 5: $2 x 2500 people = $5000, Total now $10 + $50 + $250 + $1000 + $5000 = *** $6310 ***

Yearly income: $6310 x 12 months = $75,720

Monthly income model per level and total for maintaining 6 active members @ $2 each:

Level 1: $2 x 6 people = $12, Total now $12
Level 2: $2 x 36 people = $72, Total now $12 + $72 = $84
Level 3: $2 x 216 people = $432, Total now $12 + $72 + $432 = $516
Level 4: $2 x 1296 people = $2592, Total now $12 + $72 + $432 + $2592 = $3108
Level 5: $2 x 7776 people = $15552, Total now $12 + $72 + $432 + $2592 + $15552 = *** $18660 ***

Yearly income: $18660 x 12 months = $223,920

Monthly income model per level and total for maintaining 7 active members @ $2 each:

Level 1: $2 x 7 people = $14, Total now $14
Level 2: $2 x 49 people = $98, Total now $14 + $98 = $112
Level 3: $2 x 343 people = $686, Total now $14 + $98 + $686 = $798
Level 4: $2 x 2401 people = $4802, Total now $14 + $98 + $686 + $4802 = $5600
Level 5: $2 x 16807 people = $33614, Total now $14 + $98 + $686 + $4802 + $33614 = ***

$39214 ***

Yearly income: $39214 x 12 months = $470,568

Keep in mind that it does not matter what day of the month that someone chooses to be active. It DOES
matter that they are active on that day EVERY month. The key to this is DUPLICATION! You must treat this

Carl,
The radio is being adertized as a broad band receiver from 80-999Mhz
with Tone Squelch Receive, and that does not work in the 470-800Mhz,
and the battery saver mode does not work in the 170-222Mhz and
470-800Mhz area's.
Would you buy a car, if only 6 of the 8 spark plugs
only worked.

I use this as a receiver in Tone Squelch and Yaesu can easily fix
it if it get's enough bad press on these bugs.

So again, would you buy a car that only 6 of the 8 cylinders
were working??

I will try that and let you know
A10x , anyway, The firmware is ok only on ham bands and Japan's
Public Service Band.

I hope with the AMDS programming that Tone Squelch can be
programmed in for the 470-800 Mhz and
170-222Mhz regions.

It accepts Tone squelch in receive for 380-420
, 420-470, and 800-999.

Also the save function to prolong battery life
does not work in the 470-800 and 170-222 segments.

Should like YAESU DID IT AGAIN as they say in their
advertizements!!! screwed up again , like the mailbox
and DVR and the FT-50R.

No Quality Control, No Critical Design Review
Process in debug problems.

Those radios, like almost all radios nowadays, use an
"optical chopper" do drive the processer ... the holes are
slightly offset, and tell the processor "move one step up"
or "move one step down".

Optical choppers are prone to dust clogging the holes (I
have a vintage FT-711 UHF radio here in the shack that is
doing the same thing!) ... the usual cure is to take the
radio apart, down to control head level, and blow out the
holes in the chopper with compressed air ("canned air" -
available at any computer shop or probably even Radio Shack)
works well ... usually, it takes ten times as long to
disassemble and reassemble the radio than it does to cure
the problem (which is exactly why my FT-711 hasn't been
"cured" yet ... I use the up/down buttons on the mic to move
from memory to memory).

Best of luck, and 73 to all ...

Hi:
Thanks for reading this posting.
I am a little confused as to which is the correct
mod for improving the sensitivity of the VHF RX
on the IC-706.
1) "yellow" wire mod
2) 1) plus re-attaching the "yellow" wire to the appropriate SMD tr
3) removing C153 and C53 on the PA board

I seem to have come across three differnt mod's and I am not too
sure of the various trade offs of the three mods. My understanding
is the 2) is better than 1) but I don't know whether 2) is better than 3)
I tried to look up previous mod data on this subject via Dejanews, but
I could only find comments on 1) and 2) and no comparison with 3)

Hit 30 then MR
that will put you at your memory channel #30 144.950
Now, push F/W until the the channel number 30 blinks.
Now, push on the knob and hold, and Poke the MR button.
The radio will switch to MR channel 1, and channel 30 won't be there.
you can dial up to channel 29 then channel 31. You can hit 30 MR
and the radio won't change to channel 30. Until you re-program channel
30 with a different frequency.

Hi Again John.

As I had mentioned, I was able to program a custom repeater split into the FT-50R that allowed the radio to receive on 146.52 and transmit on 446.00. The unit will not cross-band repeat but will transmit/receive on separate bands.

I have interfaced my Magellan 3000 with an XPLORER unit from
OPTOELECTRONICS. With the POWER/DATA module, you should be able to
connect the 3 wires to a DB-9 connector, and connect that to a Comm Port
of your computer. There is a DATA OUT, DATA IN, and GROUND. You would
then need the appropriate software to download the data.

I am unfamiliar with navigation software, as I am not a boater. There
must be some info on the internet.

Hello,

I don't want to seem to be overly critical but I think you
logic needs refinement.

the situation you describe above would be normal under normal
conditions. That is to say that statistically the radio would land on
one or the other memory location 50% of the time, just the same odds
as flipping a coin.

In so far as the PL is concerned, you are making some
assumptions that may not be valid. first of all lets assume that the
repeater or station your listening to stays on the air.. You would
expect that the radio would open squelch when it moves to the correct
memory with the proper PL.

However, your possible mistake is that you are assuming that
the station you have choosen is transmitting a PL tone.
------> MOST, IF NOT THE MAJORITY <------- of amateur repeaters
utilize a PL tone on receive BUT usually ---> DO NOT <--- transmit a
PL tone.

Therefore, your hyposis is faulty in that the radio would not
open squelch on the correct memory location.

In the commercial two-way world they do transmit PL tone,
however, it is usually setup so that the tone gets dropped at the same
instance the input signal goes away. BUT !!!!! The commercial
repeater transmitter still stays on the air for a brief period of time

after the PL is dropped to simulate an older system of "REVERSE BURST" used when mechanically resonate reeds were the detection process for PL tones. The reverse burst would switch the phase of the PL tone by 180 degrees and was used to stop the reed so that the receiving station speaker would cut off before the transmitter and thereby the operator would not here the harsh closing of the squelch circuit.

I hope that helps you with understanding what otherwise would appear to be a flaw in the equipment ??? This subject is covered in various books and manuals, one of which is the ARRL HANDBOOK.

Good luck on getting into amateur radio, it can be and is a rewarding experience allowing for advancement in the arts of speech and communication with a variety of peoples accross the planet and providing an environment in which one's curiosity is triggered into learning in many of the diverse fields that make up the hobby.

Cross-posted to: chi.forsale,rec.radio.swap,rec.radio.amateur.equipment,misc.forsale.non-computer

I just acquired a Microwave Modules MMT432/28S UHF
transverter, and found that I'll need to hack into my rig
in order to use it, which is something I just don't have the
time to do right now. So, I'm offering it up for sale.

It's a 10W unit, w/ GaAs front end. The unit is in great shape,
and includes the manual and schematics.

$125 shipped.

Thanks!

Paul WD8DKY

To all,

I recently picked up a Yaesu FT-23R at a hamfest. I'm looking for a copy (or original) of the manual. I'd be willing to pay copy and postage charges. Thanks a bunch, and please email copy of response!

Alan, KC2BOG

1361. FAQ: Plectron and Motorola Alert Monitor Receivers

Newsgroup: rec.radio.amateur.equipment

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their crystal controlled, transistor Plectron and Motorola desktop monitor receivers. They have now been replaced by battery operated portable pagers, and the desktop models are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. They are desktop models which can be powered from 117VAC or 12VDC with the proper mobile cord. The audio quality of a Plectron P1, Plectron 700 series, and Motorola Alert Monitor is far better than any consumer grade scanner and the sensitivity, image rejection, and intermod immunity is outstanding when aligned properly.

The Plectron and Motorola Alert monitors are single band receivers: VHF-low, VHF-high, or UHF. No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

AC power cords for both types of receivers use unique connectors and are scarce. You can buy them new but it's much cheaper to drill a hole on the rear panel and attach a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. You can also get Plectron repairs and parts from:

Northeast Communications
4 Oak Ridge Rd
Newfoundland NJ 07435
201-697-8804

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

Plectrom SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model UHF VHF-high VHF-low

SM-301 X X X
SM-302 X X
SM-303 X X
SM-304 X X

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) /
10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

I currently have no Plectrons or Motorola Alert Monitors
for sale. I'm hoarding them. :-)

Subject: Beware!! Firmware Flaws in New Yaesu VX-1R Mini_HT Don't Buy yet!!

Tone Sqeulch in receive mode is really handy when listening in
the GRMS bands, common services use the same CTCSS tone.
I listen to the Forest Service Repeaters on 171.575, during
fire season, which all tx out a PL of 103.5Hz for protected receive,
Also in Mexico is a taxi service that I
hear, If I put my FT-50R, in Tone Squelch ,I don't hear that
a Taxi Cab Repeater in Mexico blasting in across the boarder.

Also , the SAVE mode for power savings will not work while in
170-222Mhz Region (VHF-TV) and 470-800Mhz (UHF-TV).

Here, in the USA there is more than TV stations in this Frequency range!!

Anyway, the Tone, Tone Squelch , and DCS for receive don't work
in the two bands above.

Yaesu shut off the Tone , Tone Squelch, DCS, and power Battery saving
modes in BC BAND, but does not make any sense for these two bands,
when it works fine for other out of band receive.

I would not want sloppy software work, so why should you when you
pay for it and they don't deliver.

It is the same as the problem as the advertized DVR on the FT-50R
when it came out, was a joke.

Hi Again John.

As I had mentioned, I was able to program a custom repeater split into
the FT-50R that allowed the radio to receive on 146.52 and transmit on
446.00. The unit will not cross-band repeat but will transmit/receive
on separate bands.

Subject: crossband

Hi Jim,
The FT-5100 is capable of full duplex crossband. You can set it so
when it receives a signal on one band,it re-transmits it on the other,and
vice-versa. No mod is required to do this. It is explained in fair detail
in the Yeasu manual. My friend has that rig,and it works great. It also
has dual in-band receive for monitoring two 2mter freqs. or two 440 freqs.
simult. I have the 8100R and it also has these features,plus ext. rec.
I think you will be very happy with it. Hope you get a good deal on the
radio

On the newer units, this does not work! It converted the radio to the
Japanese band plan in the first run units. Check out this URL. It will
give you all the info you need to know.

I have interfaced my Magellan 3000 with an XPLORER unit from
OPTOELECTRONICS. With the POWER/DATA module, you should be able to
connect the 3 wires to a DB-9 connector, and connect that to a Comm Port
of your computer. There is a DATA OUT, DATA IN, and GROUND. You would
then need the appropriate software to download the data.

I am unfamiliar with navigation software, as I am not a boater. There
must be some info on the internet.

Tone Sqeulch in receive mode is really handy when listening in
the GRMS bands, common services use the same CTCSS tone.
I listen to the Forest Service Repeaters on 171.575, during
fire season, which all tx out a PL of 103.5Hz for protected receive,
Also in Mexico is a taxi service that I
hear, If I put my FT-50R, in Tone Squelch ,I don't hear that
a Taxi Cab Repeater in Mexico blasting in across the boarder.

Also , the SAVE mode for power savings will not work while in
170-222Mhz Region (VHF-TV) and 470-800Mhz (UHF-TV).

Here, in the USA there is more than TV stations in this Frequency range!!

Anyway, the Tone, Tone Squelch , and DCS for receive don't work
in the two bands above.

Yaesu shut off the Tone , Tone Squelch, DCS, and power Battery saving
modes in BC BAND, but does not make any sense for these two bands,
when it works fine for other out of band receive.

I would not want sloppy software work, so why should you when you
pay for it and they don't deliver.

It is the same as the problem as the advertized DVR on the FT-50R
when it came out, was a joke.

Date: 14 Jul 97 01:07:34 GMT
From: a19@a.a
Subject: $$$$$ LOAN BUSINESS, EASY MONTHLY INCOME, NO BRAINER $$$$$$$

I have participated in the standard "Please put me on your mailing list" letter
and found it to be worth
my time (I get 1 or 2 handfulls or letters every day) but I also found that
it's results were nowhere
near what I expected due mainly to people not sending in the money but rather
spreading the letter
without paying for it. I participated in that mainly as an experiment and found
that there are a
tremendous amount of people willing to do it. I thought about how to, first,
eliminate the "non-pay"
problem and, second, to create a monthly income. I came upon the solution and
decided to start a new
program. I decided that there were 3 things that this new program needed in
order to work for everyone
and they were: 1.) It needed to be very simple and easy for anyone to do, and,
2.) It needed to be
inexpensive enough for even the poorest of people, and, 3.) It needs to be
DUPLICATABLE. I think you
will find this program to meet those requirements. I have put lots of thought
into it and I ask that you
PLEASE do NOT modify it. This WILL WORK if you follow it. This system is based
on the unconditional
"loaning" of money to people. Simply say, "I am loaning you this $2 as an act
of goodwill to help you in
your financial need, you may pay me back if and when you can." You should find
5 or more people who will
send $2 to the 5 needy people on this list AND MAINTAIN 5 or more people who
will do the same. You

should put your name on postition number 5 and move each of the other names up one position. The name
originally on position number 1 gets removed. You should be able to contact each of your 5 or more
people to see if they are going to be active this month. If not then you need to find one or more people
to be active in order to maintain at least 5. I am not speaking about the 5 people on the list but
rather the 5 new people you have found. I would highly suggest having more than 5 in any given month.
Now I know that this would be extremely easy to do since I can think of at least 20 people myself who
will do this consistently. The key is to maintain at LEAST 5 active people. If you don't then you can't
expect for the rest of the people to do it either and you can't expect for this system to work. This
system is a no-brainer, and if someone can't afford the $10 + stamps for this then they truly ARE in
need! It is OK to use the internet to find people but I think it would be easier to find them through
people that you know. This way it will be easier for you to contact them every month to ask about their
being active, unless someone is willing to give you their e-mail address. Here are some numbers:

Monthly income model per level and total for maintaining 4 active members @ $2 each:

Level 1: $2 x 4 people = $8, Total now $8
Level 2: $2 x 16 people = $32, Total now $8 + $32 = $40
Level 3: $2 x 64 people = $128, Total now $8 + $32 + $128 = $168
Level 4: $2 x 256 people = $512, Total now $8 + $32 + $128 + $512 = $680
Level 5: $2 x 1024 people = $2048, Total now $8 + $32 + $128 + $512 + $2048 = *** $2728 ***

Yearly income: $2728 x 12 months = $32,736

Monthly income model per level and total for maintaining 5 active members @ $2 each:

Level 1: $2 x 5 people = $10, Total now $10
Level 2: $2 x 25 people = $50, Total now $10 + $50 = $60
Level 3: $2 x 125 people = $250, Total now $10 + $50 + $250 = $310
Level 4: $2 x 500 people = $1000, Total now $10 + $50 + $250 + $1000 = $1310
Level 5: $2 x 2500 people = $5000, Total now $10 + $50 + $250 + $1000 + $5000 = *** $6310 ***

Yearly income: $6310 x 12 months = $75,720

Monthly income model per level and total for maintaining 6 active members @ $2 each:

Level 1: $2 x 6 people = $12, Total now $12
Level 2: $2 x 36 people = $72, Total now $12 + $72 = $84
Level 3: $2 x 216 people = $432, Total now $12 + $72 + $432 = $516
Level 4: $2 x 1296 people = $2592, Total now $12 + $72 + $432 + $2592 = $3108
Level 5: $2 x 7776 people = $15552, Total now $12 + $72 + $432 + $2592 + $15552 = *** $18660 ***

Yearly income: $18660 x 12 months = $223,920

Monthly income model per level and total for maintaining 7 active members @ $2 each:

Level 1: $2 x 7 people = $14, Total now $14
Level 2: $2 x 49 people = $98, Total now $14 + $98 = $112
Level 3: $2 x 343 people = $686, Total now $14 + $98 + $686 = $798
Level 4: $2 x 2401 people = $4802, Total now $14 + $98 + $686 + $4802 = $5600
Level 5: $2 x 16807 people = $33614, Total now $14 + $98 + $686 + $4802 + $33614 = *** $39214 ***

Yearly income: $39214 x 12 months = $470,568

Keep in mind that it does not matter what day of the month that someone chooses to be active. It DOES
matter that they are active on that day EVERY month. The key to this is DUPLICATION! You must treat this
as a business. If you treat it like a hobby that is how it will treat you. You could even organize small
meetings with your people and their prospects and work with your leaders. Think of how easy this would be for you, how reasonable this is, and of how good the chances are of it
working for you. You may need to hire someone to open all the envelopes.

NOTE: I decided on $2 instead of $1 because it is more feasible and it won't matter much for someone to
send $2 as opposed to $1. Also I was against $5 as that becomes too expensive to duplicate.

Mail $2 every month with a piece of paper saying "I am loaning you this $2 as an act of goodwill to help
you in your financial need, you may pay me back if and when you can" to the following needy people:

Subject: ADI AT-600

I am also looking at buying an ADI AT-600. I went to Ham Radio Outlet
because they list it in their catalog and the guy said the Portland, OR
store didn't order any because they were unfamiliar with the radio. He
said that the other stores had some but that doesn't help me much. He did
his darndest to sell me an ICOM ICW32A or a Kenwood TH79A. They both look
like good radios but I like the specs on the ADI better. I am particularly
interested in the expanded TX and RX range available with software and
hardware mods. Both of the other radios have a much more limited range.
As of now I am holding off but unless someone can change my mind I will
have them order the ADI radio. I guess someone has to be the first one to
try something new!

It is part of the Magnisun (sp) consumer protection and warrantee
legislation. The provision was aimed at the appliance and auto
industries, but its wording isn't limited to them. A manufacturer
can dodge the law by disclaiming all warrantee at time of sale,
IE by representing the product "as is" with no claim of fitness
or suitability stated or implied. Big ticket items almost never
are sold that way because it alarms the consumer to lay out a
large chunk of cash without some recourse if the product fails.

From: dddavis@atl.mindspring.com (Donald D. Davis, Jr.)
Subject: crossband

The FT5100 does have crossband repeat with no mod required. I think this radio is especially good for crossband because you can combine DTMF code squelch functionality with the crossband function to prevent accidental triggering by other stations.

best of luck, Don (KE4KYO)

sweeper44@aol.com (Sweeper44) wrote:

From: mwilson@flex.net (Monty Wilson)
Subject: IC-2000H memory corruption

I have programmed several memory channels' information
into this 2m rig, an Icom IC-2000H. Frequency, offset, tone
frequency and mode, alphanumeric channel names. They
are supposed to be stored in nonvolatile memory, and that
appears to be happening OK. But about once a month, the
radio, when you turn it on, flashes ICOM on the display for
a second then turns itself off. The radio manual says when
that happens, it means that the nonvolatile memory has been
corrupted, and gives directions for a master reset of the system.
In every case, this master reset has cleared up the problem but
of course means you must go through all the programming again.

Has anyone experienced similar problems? Please let me know.

.........Monty N5NVM.

I had the same problem. I found that I forgot to shut the radio off when
I tuned on the ignition. Evidently, there is a voltage spike that can
do damage to your radio if you don't have it off when you start your
car.

Subject: Icom 735 - TX offset? zero beating?

Does anyone have access to an Icom 735 service manual? I would like to know
the
CW TX offset. My owners manual states that the CW sidetone frequency is
800Hz.
I would like to know if I can use this side tone to zero beat the radio on
a CW signal.

Any help would be appreciated greatly!!

Please post replies to my email address so I don't junk up the newsgroup!
I will post the answers I get. Maybe it will help someone else!

Subject: Johnson, Gonset and WRL transmitters FS

Classic Ham Radio Equipment for Sale - Three items.

1. Johnson Viking II Transmitter AM and CW 120 watts. $175

2. Gonset GSB-100 Transmitter SSB, DSB, AM, PM, CW 100 watts $125.

3. WRL Globe King 400 Transmitter. No cabinet - has three separate 19" rack
mount sections. A basket case but very restorable. $100.

Due to their weight and size, these items are difficult to ship and must ask for direct pickup. I am located in Tully, NY, about 15 miles south of Syracuse.

Many thanks and please email for more info. Mort Caldwell W8IFN caldbio@dreamscape.com

From: djeo1@mail.telis.org
Subject: "HELP!!!" Noise in Kenwood TM-631A

I need help on my 2m/220

I run my radio mobile with it connected directly to the battery. I
have owned the radio for about six years now and never had a problem. About
2 months ago I started to lose stored memory. So I changed the lithium
battery. It did not cure the problem, however I ended up with another one.

When I tune the radio on 2m (in main band) to a fixed station (i.e.
NOAA) I get noise in the foreground and I can hear NOAA in the background.
When I do a band band change (220 now in main band and 2m in sub-band) NOAA
signal comes in clear. When I switch back to 2m in main band, everthing works
properly from there on as long as I keep the radio on. When I turn the radio
off, then turn it back on, the same problem occurs. I checked very closely to
the circuit where I soldered the battery to see for any circuit damage had
occured or if I lifted any traces. Everything looks fine. In fact changing the
battery was a very easy proceedure. I have checked wires and all.

Does anybody have a clue as to the problem? Any response will be
appreciated. Please respond to

djeo1@mail.telis.org

Thanks

>-Jim

I tried that *once*. I wasn't very happy. You've got a tangle of wires
to deal with (coax, power, external mike, external speaker, etc), and HT
audio is still inferior to what you get with a mobile. I also didn't like the
idea
of constantly connecting and disconnecting the antenna connector on the HT.
Those connectors aren't intended for that, and they wear out quickly. Plus
even a good HT will have a much greater tendency to overload and suffer
IMD than will most mobile rigs. I think it is better to reserve the HT for
HT type things and get a real mobile rig to permanently mount in the
vehicle.

>one so
>thanks in advance.

The place for the low pass filter is at the amplifier output. The amp will
always
be dirtier than the transceiver. Bond the filter to the amplifier case, and
make
sure the amplifier is well bonded to station ground. The transceiver needs to
be
bonded to station ground too, via a separate ground cable, and not daisy
chained
to ground via the amplifier. Doing the latter can induce RF feedback.

Subject: Speaker Tip

I picked up a new MFJ ClearTone speaker model mfj-281 at the hamfest. This thing is amazing! CW sounds clearer and louder than with any speaker I've tried so far and I've tried many. It's only 3" square, has a mounting bracket and cost a whopping $10. I've put my big speakers in the closet for now. This speaker was designed for ssb and sounds great in that mode too. Copy through qrn is much better now.

From: a19@a.a
Subject: $$$$$ LOAN BUSINESS, EASY MONTHLY INCOME, NO BRAINER $$$$$$$

I have participated in the standard "Please put me on your mailing list" letter
and found it to be worth
my time (I get 1 or 2 handfulls or letters every day) but I also found that
it's results were nowhere
near what I expected due mainly to people not sending in the money but rather
spreading the letter
without paying for it. I participated in that mainly as an experiment and found
that there are a
tremendous amount of people willing to do it. I thought about how to, first,
eliminate the "non-pay"
problem and, second, to create a monthly income. I came upon the solution and
decided to start a new
program. I decided that there were 3 things that this new program needed in
order to work for everyone
and they were: 1.) It needed to be very simple and easy for anyone to do, and,
2.) It needed to be
inexpensive enough for even the poorest of people, and, 3.) It needs to be
DUPLICATABLE. I think you
will find this program to meet those requirements. I have put lots of thought
into it and I ask that you
PLEASE do NOT modify it. This WILL WORK if you follow it. This system is based
on the unconditional
"loaning" of money to people. Simply say, "I am loaning you this $2 as an act
of goodwill to help you in
your financial need, you may pay me back if and when you can." You should find
5 or more people who will
send $2 to the 5 needy people on this list AND MAINTAIN 5 or more people who
will do the same. You
should put your name on postition number 5 and move each of the other names up

one position. The name
originally on position number 1 gets removed. You should be able to contact
each of your 5 or more
people to see if they are going to be active this month. If not then you need
to find one or more people
to be active in order to maintain at least 5. I am not speaking about the 5
people on the list but
rather the 5 new people you have found. I would highly suggest having more than
5 in any given month.
Now I know that this would be extremely easy to do since I can think of at
least 20 people myself who
will do this consistently. The key is to maintain at LEAST 5 active people. If
you don't then you can't
expect for the rest of the people to do it either and you can't expect for this
system to work. This
system is a no-brainer, and if someone can't afford the $10 + stamps for this
then they truly ARE in
need! It is OK to use the internet to find people but I think it would be
easier to find them through
people that you know. This way it will be easier for you to contact them every
month to ask about their
being active, unless someone is willing to give you their e-mail address. Here
are some numbers:

Monthly income model per level and total for maintaining 4 active members @ $2
each:

Level 1: $2 x 4 people = $8, Total now $8
Level 2: $2 x 16 people = $32, Total now $8 + $32 = $40
Level 3: $2 x 64 people = $128, Total now $8 + $32 + $128 = $168
Level 4: $2 x 256 people = $512, Total now $8 + $32 + $128 + $512 = $680
Level 5: $2 x 1024 people = $2048, Total now $8 + $32 + $128 + $512 + $2048 =
*** $2728 ***

Yearly income: $2728 x 12 months = $32,736

Monthly income model per level and total for maintaining 5 active members @ $2
each:

Level 1: $2 x 5 people = $10, Total now $10
Level 2: $2 x 25 people = $50, Total now $10 + $50 = $60
Level 3: $2 x 125 people = $250, Total now $10 + $50 + $250 = $310
Level 4: $2 x 500 people = $1000, Total now $10 + $50 + $250 + $1000 = $1310
Level 5: $2 x 2500 people = $5000, Total now $10 + $50 + $250 + $1000 + $5000
= *** $6310 ***

Yearly income: $6310 x 12 months = $75,720

Monthly income model per level and total for maintaining 6 active members @ $2 each:

Level 1: $2 x 6 people = $12, Total now $12
Level 2: $2 x 36 people = $72, Total now $12 + $72 = $84
Level 3: $2 x 216 people = $432, Total now $12 + $72 + $432 = $516
Level 4: $2 x 1296 people = $2592, Total now $12 + $72 + $432 + $2592 = $3108
Level 5: $2 x 7776 people = $15552, Total now $12 + $72 + $432 + $2592 + $15552 = *** $18660 ***

Yearly income: $18660 x 12 months = $223,920

Monthly income model per level and total for maintaining 7 active members @ $2 each:

Level 1: $2 x 7 people = $14, Total now $14
Level 2: $2 x 49 people = $98, Total now $14 + $98 = $112
Level 3: $2 x 343 people = $686, Total now $14 + $98 + $686 = $798
Level 4: $2 x 2401 people = $4802, Total now $14 + $98 + $686 + $4802 = $5600
Level 5: $2 x 16807 people = $33614, Total now $14 + $98 + $686 + $4802 + $33614 = *** $39214 ***

Yearly income: $39214 x 12 months = $470,568

Keep in mind that it does not matter what day of the month that someone chooses to be active. It DOES matter that they are active on that day EVERY month. The key to this is DUPLICATION! You must treat this as a business. If you treat it like a hobby that is how it will treat you. You could even organize small meetings with your people and their prospects and work with your leaders. Think of how easy this would be for you, how reasonable this is, and of how good the chances are of it working for you. You may need to hire someone to open all the envelopes.

NOTE: I decided on $2 instead of $1 because it is more feasible and it won't matter much for someone to send $2 as opposed to $1. Also I was against $5 as that becomes too expensive to duplicate.

Mail $2 every month with a piece of paper saying "I am loaning you this $2 as an act of goodwill to help you in your financial need, you may pay me back if and when you can" to the following needy people:

Subject: ADI AT-600

I am also looking at buying an ADI AT-600. I went to Ham Radio Outlet because they list it in their catalog and the guy said the Portland, OR store didn't order any because they were unfamiliar with the radio. He said that the other stores had some but that doesn't help me much. He did his darndest to sell me an ICOM ICW32A or a Kenwood TH79A. They both look like good radios but I like the specs on the ADI better. I am particularly interested in the expanded TX and RX range available with software and hardware mods. Both of the other radios have a much more limited range. As of now I am holding off but unless someone can change my mind I will have them order the ADI radio. I guess someone has to be the first one to try something new!

It is part of the Magnisun (sp) consumer protection and warrantee
legislation. The provision was aimed at the appliance and auto
industries, but its wording isn't limited to them. A manufacturer
can dodge the law by disclaiming all warrantee at time of sale,
IE by representing the product "as is" with no claim of fitness
or suitability stated or implied. Big ticket items almost never
are sold that way because it alarms the consumer to lay out a
large chunk of cash without some recourse if the product fails.

From: Kerry-Ann Lecky <yu106888@kelvin.eas.yorku.ca>
Subject: ADI AT-600

Right now I'm looking into buying an ADI AT-600 (dual band handheld) but I'm a bit hesitant because the price is so low (100 -200 dollars cheaper than average dual band HT's with fewer capabilities). Anyway, I'm just looking to hear from anyone with any problems or comments regarding this type of handheld and/or its manufacturer.

I believe the ADI web site is at http:\\www.adi-radio.com

Thanks,

Kerry

From: Shawnerz@xSprintmail.com (Shawn)
Subject: FS-FT: Broken ICOM 02-AT For Parts

I have an Icom 02-AT HT for sale or trade. IT DOES NOT WORK!
Problems:
Volume knob does not turn the power off

The mylar ribbon cable that interconnects the 3 PC boards together is tearing. Because of this, the PTT doesn't work, the keyboard is intermittant. I'm tired of doing repairs and I'm getting dimishing returns.

Included is 2 BP-3 battery packs and 1 (maybe two, I have to check my parts bin) final PA transistors-but NO ANTENNA. I blew a couple out several years ago before I found that you can't transmit in high power with a rubber duck antenna and a speaker mic. It's a long story, but that part is fixed.

Asking price: $40-you ship. I'm not really interested in the money, I'm more interested in what you might have to trade.

Current wants:

2 Network cards (ISA to 10base2 perfered)
220 equipmet
SCSI equipment (cards, cables, whatever-again ISA)
you name it.

Does anyone out there know of a Fix for the skipping problem
that the FT-2400's and FT-2500 have ?

You move the vfo knob and somtimes it changes freqency others
it skipps , Like 2 or 3 memory locations or the same in direct
frequency dialing.

I have not tried this yet, but I have it on good authority that you
press the function key for 1 sec, then MR when on the channel you want
to delete.

Funny that that was not in the manual! The only way I could delete
channels before was to use the ADMS software.

That gizmo is available. I believe it is the CT-44 adapter that converts the 4 pin connector of the FT-50R or the VX-1R to a dual jack setup.

Hi again, Dick.

I have both of the Yaesu models. I rarely use the FT-51R anymore, and almost ready to sell the beast. The FT-51R is a true dual band radio, with essentially two tranceivers built in one HT. It does not have 800 Mhz (at least the US version), and it does not have DCS. Many commercial services are going to DCS(digital coded squelch). The true dual band feature is good if you wish to continuously monitor two frequencies. I found it to be a pain, as when you are transmitting on one band, you may receive another signal on the other band, kind of throwing you off from your concentration. You can auto mute the other band or decrease the volume, though. In reality, I never use the unit to monitor more than one frequency at a time.

The FT-50R is less expensive and very versatile, It does have DCS and despite some limitations, is a very good scanner. It has 800/900 Mhz as well. You can only monitor one band at a time, but you can use its priority feature to check another frequency intermittently. It has 5 scan ranges. The wide band FM reception is terrible and unusable for the most part. This is my preferred HT, and it accompanies me on trips! For a full rundown on the unit, and mods (especially the super-awsome mod) check out this URL:

http://members.gnn.com/hca/ft50/index.htm

Unless dual band receive is important to you, I would definitely place the FT-50R above the FT-51R. It is a good (not excellent) scanner and an excellent ham HT. If you have to bring one unit with you on trips, you can use this one for all your needs.

I also have the new VX-1R mini dual band handheld, which is impressive in it's own right (no, I don't own stock in Yaesu) but will not completely replace the FT-50R. They did fix the FM-Wide reception, but the radio is relatively deaf in the 800/900 Mhz region.

As far as accessories, the FT-51R has a neat microphone that displays the operating frequency. That is an excellent feature. The FT-50R has

Subject: Beware!! Firmware Flaws in New Yaesu VX-1R Mini_HT Don't Buy yet!!

I didn't see where the gentleman ever stated that he wanted "to
transmit" anywhere. In fact, he clearly indicates that he wants to use
the radio to receive. In many parts of the Country, and in other parts
of the world, the 470-520 band is heavily used.

Secondly, the same goes for the 170-174 portion of the "VHF-TV" band. US
Government uses a lot of spectrum in that 4 Mhz.

CTCSS and DCS is common in all of the operations. And yes, PL/DPL does
not eliminate intermod, but, it most certainly does eliminate most of
the noise coming out of the speaker that is associated with it.

The radio, however cute, has flaws. The radio is advertised with
features it simply does not have. The FT50 was originally advertised as
capable of wide band FM for broadcast reception, which was hardly even
half true. The VX-1 is advertised as being 1 watt with the external
power adapter, yet the "errata" sheet that comes with the manual says:

"However, transmission in this configuration may result in some amount
of extraneous hum and noise being transmitted... we recommend that you
transmit...only in an emergency." Can you find this little minor
confession in the radios advertisements?? No you can't, this is one of
them little flaws Yaesu is so proud of hiding and hoping that it won't
be found out. Also, has anyone yet figured out the "290" memory channel
BS?

If you want a 1/2 watt radio that transmits and receives in the 2 meter
band and part of the UHF ham bands, then you came to the right place.
Anything else may be vaporware and should not be considered a plus prior
to purchasing until you have determined the actual abilities of the
radio.

Carl,
The radio is being adertized as a broad band receiver from 80-999Mhz
with Tone Squelch Receive, and that does not work in the 470-800Mhz,
and the battery saver mode does not work in the 170-222Mhz and
470-800Mhz area's.
Would you buy a car, if only 6 of the 8 spark plugs
only worked.

I use this as a receiver in Tone Squelch and Yaesu can easily fix
it if it get's enough bad press on these bugs.

So again, would you buy a car that only 6 of the 8 cylinders
were working??

Subject: CROSSBAND REPEATING

Just purchased the Icom 2350H and managed to handle "all" functions except
when it came to putting
the radio in crossband repeat, which is the reason I bought the radio in
the first place. The manual
Icom included with the radio barely mentioned this feature! I do data
input and work from 11PM till 7AM
and really need to get this function working so I can talk with my friends
through the night. If you can
help please email me directly at pentode@sundial.net. I've not been able
to contact Icom regarding this.

Thanks, Tom Haley KC4ZVM IN Orlando, Florida.

From: <tnic@IDT.NET>
Subject: FT50-R VOX Recommendations??

I could use a VOX set up for my FT-50R. I tried the NIMA VOX mike and did
not like it.

Yaesu makes the VC-22 Headset which has an over the head wire big ear pad
and mike boom. It looks to me like this is a bit larger than it needs be.

Anyone know of a simple ear bud with a mike boom thats VOX and small?

It makes no sense to me to have a small radio and a big headset.

PS: The Yaesu connector for the FT-50is a single jack affair rather than
the dual prong like most radios. I would prefer the single jack to an
adapter gizmo.

Thanks & 73

I called RT Systems, the authors of the package, at (205)880-3093. Rod says that the interface is proprietary (I wanted to write a Mac version) and their special interface cable is actually an active circuit that needs voltage from the PC to run. He was very helpful suggesting how to get it running on my Mac. SoftWindows or other emulator and an adaptor cable with 9v going to pins 7/8 with ground on 5 of their DB-9 (but don't let these voltages go back to the Mac).

Don't hold your breath.

But in all "honesty" I did discover the VX-1R "290 memories". It takes some tricky math, and you have to count a few memories that are not useable for much, but you do get them. It is just unfortunate that two thirds of them do not meet any reeasonable definition of a "memory channel". Even with the convoluted method of coming up with 290, it would not have been so bad if they were all available in one "group". As it is now, you have to do a multi button power up to switch between the 2 groups.

At least the thing doesn't generate all kinds of "cracklies" on the UHF transmitter. Still gotta wonder about the 1 watt deal, and the Feds have gotta wonder about a "Yaesu provided MARS mod" that opens the cellular band.

Tom

Our club is in need of a couple duplexers for a pair of 70cm repeaters. If you have one you'd like to sell, please email me with details.

I really don't know too much about duplexers so any advice about suitable units would also be appreciated. Both machines will be sharing the sites with commercial users in the 460 MHz range. Our machines will be GE's with output in the 75-100W range.

Thanks & 73... Mark AA7TA markem@primenet.com

1380. Resolution to Yaesu FT900AT Split Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-15 00:00:00 UTC
From: Vic <nospam.vgadzik@vivanet.com>
Message-ID: <33CC364E.41B1@vivanet.com>
Source record: 170193

A couple of weeks ago I posted a note regarding this scenerio:

Set VFO A xmit on 15 meters, and VFO B recv on 10 meters (for RS-12).
Run SPLIT, CW, low power, and CW speed about 12:00 on dial.

Problem: Radio will send DAHS, but no power out on DITS.
In band (no cross band) Split works fine.

Called Yaesu support, and finally after 5 days of trying, finally
got thru. They confirmed the problem does exist, blamed on "too fast
for the internal relay to handle".

Their solution: Don't run full break in; Run in semi break mode.

OK, I guess it's a solution, but once you get used to full break in,
going back to semi is no fun at all, especially in a contest or weak
contact like RS12, where you really need to listen between each dit!
One thing is very odd though, they have a switch to turn off the
internal relay, and use some type of internal electronic switching.
It quiets the radio down when sending at low volume levels...
But when you run split (any band), it turns on the internal relay,
no matter what the switch is set for. Wonder if that could be defeated,
and run electronic switching unit during split...

Oh well...

Vic K2YW

> Thanks, John

John: It's all a matter of semantics. For what you want to accomplish, the answer is yes. The people telling you it can't be done probably don't understand your question (or else they really don't understand the FT-50R, but I hope not!).

You can program standard repeater offsets, non-standard repeater splits, and (pertinent to your question) two completely unrelated frequencies for receive vs. transmit. So you could transmit on a 70cm frequency, receive that on your crossband mobile rig, which re-transmits it on the input frequency of a 2 meter repeater, and receive the 2 meter repeater output on your FT-50R. It's a little tricky to do from the keypad, and easy as pie to set up with the ADMS software. By the way, be sure that you understand how the crossbanding mobile rig works. When I tried to set up a similar arrangement using a Yaesu FT-5100 in the car, I found that the crossband repeat transmits both ways. So I could set up the FT-50r to EITHER receive the output of the 2M repeater, OR set up the FT-50r to receive that signal as it was re-transmitted on the 70cm band by the FT-5100. For example:

What I did =

```
FT-50R FT-5100 LOCAL REPEATER
-------------- --------------------------- --------------
449.300 Xmit---->449.300 Rcv---->147.810 Xmit-----> 147.810 Rcv
444.300 Rcv<-----444.300 Xmit<---147.210 Rcv<------ 147.210 Xmit
```

-vs-

What you propose to do =

```
FT-50R FT-5100 LOCAL REPEATER
-------------- --------------------------- --------------
449.300 Xmit---->449.300 Rcv---->147.810 Xmit-----> 147.810 Rcv
147.210 Rcv<------------------------------------- 147.210 Xmit
```

The first method has the advantage if the output of the repeater you are trying to hit is somewhat marginal compared to the output of the nearby mobile rig doing the crossbanding. When I'm down in the basement of my large concrete-and-steel building where I work, I can't either hit or hear my favorite local 2 meter repeater. But using the bidirectional crossbanding mode shown above, I could reach from the basement to my car, and from the car to the repeater. (By the way, I recommend using both tone encode and tone decode on the crossband radio, if at all possible, to minimize re-transmission of junk.

The second method (the one you planned) is advantageous if the mobile rig is unlike the FT-5100 and can't do bi-directional crossband repeat. For example, the Yaesu FT-3000 can only receive on the 70 cm band, not transmit there.

The FT-50 actually does have two VFO's, but is unlike some "true dual-band" HT's in that it can't exactly listen to both channels at the same time. On my FT-5100 mobile rig, I can have two unrelated frequencies dialed in to the "left" and "right" sides of the radio, and there is a balance control that allows me to hear the "left" side louder than the "right" side, for example, to help me know which side is "talking" without looking at the display. Even if I'm talking on a 2M repeater on the main ("left") side of the radio, I can hear what's happening on the "right" side frequency. So if someone is calling me on a 440 frequency while I'm talking on a 146 frequency, I will hear it. If I want to answer, I can interrupt the QSO on the 2 meter side, hit the "band" button on the FT-5100, and swap the two VFO's, so I can immediately reply on the other frequency. (You can only transmit on the "left" side VFO.) While the VFO's are swapped, I can still hear on the "right" side VFO, which is the 2 meter freq in this example.

The closest you can come to this with the FT-50 is to use the "dual watch" feature. The main channel works normally, and the "sub-channel" is periodically sampled for a signal. If one is found, AND IF YOU ARE NOT TRANSMITTING ON THE MAIN CHANNEL AT THT TIME, the radio will beep at you and switch to the sub-band frequency for monitoring. Three of the four dual-watch modes seem only marginally useful to me, since the sub-channel is checked only once per 5 seconds. The most useful dual-watch mode is the V/V mode, where VFO A and VFO B hold the two bands being worked -- the sub-band is checked wcwey 200 ms. However, when the radio swaps VFO A with VFO B to receive the sub-band signal, you can't talk on the sub-band frequency until you hit the keys needed to cancel the dual watch mode. So it's a bit more awkward. And this is the type of limited "dual band" operation that has caused some folks to tell you it can't be done unless you trade up to an FT-51. It is apparently closer to the "true dual band" mode that my FT-5100 mobile rig can perform.

I hope that helps.

1397. VX 1-R SMART SEARCH HELP

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-15 00:00:00 UTC
From: "Ira H. Sachs" <irasachs@wwa.com>
Message-ID: <33CC54A5.7E31@wwa.com>
Source record: 170210

I am able to easily activate the SMART SEARCH feature easily,
however it appears to work ONLY on the ENTIRE band selected.

Am I missing something here?
I would like to be able to SMART SEARCH smaller portions of
the band.

I know that I can generate a PROGRAMMED SCAN but it does
not work as well as the SMART SCAN feature?

What did I miss? Can anyone help?

Thanks de WB9HNV

Ira

>
> Dirk Bremer

Basically, a duplexer is a sharp, high-performance filter.
In repeater applications, it is common to use one antenna
for both transmit and receive, and use the duplexer,
usually two or three cavities on each side, to
prevent interference between the transmitter and receiver.
Tuning is very critical in repeater applications, and needs
to be done by an expert with appropriate equipment.

The cans basically contain two stubs that cross-couple
the power between the input and output ports.

Radios on different frequency bands usually do not
interfere with each other much, and so cross-band
radios do not usually need duplexers.

Note that to combine two different band radios into
one antenna, a much simpler duplexer is sufficient,
as the frequencies are so different. These duplexers
are sometimes as small as a paperback book.

From: Tomoko Takayama <rc168@email.msn.com>
Message-ID: <01bc91ae$44615de0$7b5f2299@gsr>
Source record: 170213

I have a Yaesu FT-50 and a Kenwood TH79. I purchased some Comet antennas to improve the gain of the radios. Since Yaesu only can use SMA connector, therefore, I got a SMA to BNC adapeter in order to put the Comet CH-72S antenna on it. Is that bad for the radio? Does those adapters leak out signals? I also got some car antennas which have N type connectors, so I got those N to BNC connectors as well. Is that OK? What should I be looking out for when I use those adapters? THANKS!

From the HD-73 Owner's Manual:

The HD-73-1 has the heaviest pitch gear teeth (steel hardened) of any rotator in its size and price range.

The HD-73-1 control unit features TWO-SPEED rotation with one five-position switch. This presents a one revolution per minute speed for rotating over an extended are and a slower speed for adjustment of, say, several degrees one way or the other for fine adjustments for the best signal on receiving and transmitting.

The rotator not only has a readily accessible externally located fuse for total unit protection, it also has an internally mounted automatic reset thermal protector for the motor and transformer against shorts or possible connection error or prolonged operation.

A large, back-illuminated 3 1/2" Jewell D'Arsonval, Taut Band, linear, full scale 100° swing, meter is calibrated in bold S-W-N-E-S as well as a degree-graduated scale.

The meter direction indicating voltage supply is solid state voltage regulated for meter indication accuracy regardless of wide line voltage or load variation; the regulating range is 105 to 129 volts.

The HD-73-1 rotor was designed to operate antennas with a maximum of 10.7 square feet of wind load area when properly installed.

Diameter of rotator unit -- 8".
Mast mounting size range -- 1-3/8" O.D. to 2-1/2" O.D.
Mounting option -- in tower (preferred), or on tower or mast.
Cable -- 6 conductor.
Voltage input -- 117 volts A.C., 60 hertz, + 12 volts.
Rotator weight (bare) -- 6-3/4 lbs.
Rotator with 1 pair antenna brackets -- 9-1/8 lbs.
Rotator with 2 pair brackets -- 11-1/2 lbs.
Shipping weight -- 17 lbs.
Rotator speed -- Dual -- 1 R.P.M. and a pinpoint slower speed.
Motor -- capacitor split phase, reversible. Motor voltage -- 20 volts A.C. No voltage on motor or leads exceeds U.L. safety limits.
Transformer, power -- Double protected -- fuse and thermal protectors.
Meter -- D.C. D'Arsonval, taut band. Meter scale -- S.W.N.E.S. and degree scale.

WIND LOAD INFORMATION

Severe installation and duty requirements are placed upon antenna rotors and supports by communication antenna arrays. The factors involved in such installations have been under investigation for many years to determine the effect of such requirements on antenna rotators, and how to design and manufacture rotators that will support and operate antennas under the very adverse conditions that exist in some localities. These locations are not only those of high wind velocity but also those of additional ice loading and severe conditions that exist during periods of blizzard and peak gusts of wind that occur in many areas.

The Unites States Weather Bureau furnished fastest mile per hour velocity figures from many recording stations around the United States. Measurements have been made of the relationship of gusts for fastest miles per hour data by the Bureau showing that gusts exceed fastest wind velocity data generally by 30%.

As a result of the above, the Electronic Industry Association (EIA) has recommended a wind loading standard of 30#/sq. ft. of projected surface for the purpose of design by United States manufacturers. This corresponds to a wind velocity of 110 mph. The use of this standard in design procedures will consistently yield products better able to withstand successfully most prevailing wind conditions in the U.S.A.

This brings us to the subject of Bending Moment, also called Side Thrust Overturning. Wind loading or wind pressure acting on an antenna, rotator and tower are essentially the

same as those acting on buildings, water towers
and other structures. Wind loading is by far the most critical and
severe item to be considered for antennas, rotators
and tower life. A typical 3 element vertical C.B. antenna creates a
bending moment of 1700 lb. ft. and necessitates
in-tower mounting. Other C.B. antennas are vertically polarized and
can exceed these values.

The easy way to remember which paddle is which, regardless of right- or left-handed, is that "dots are sent with the thumb, cause "dot's" the one "dot's" closest to de middle of your body" -- or so it was told to me.

From: dubner@spk.hp.com (Joe Dubner)
Subject: IC-706 Serial Data Format?

Thanks to K7YJ, N2ZZ, and N6MZV for the replies via E-mail. This
information is from Bob, N6MZV. (I've intentionally omitted his
E-mail address.)

Bob says:

It's ttl level 8n1 data - you can set the baud rate, or let the 706 go
autobaud. If you're only talking from one radio to one computer, you can
use a single MAX232 to do the level shifting to true RS232 levels (you
can get away with a single transistor and a couple resistors and diodes
if you don't want true RS232 levels, but I find the MAX232 route more
reliable).

The Icom box is expensive because the interface is actually a party line
(open collector) design that allows multiple radios to sit on the same
serial bus, and even to control each other. I believe the box also
provides optical isolation which is about the best way to reduce RF
problems.

As to actual data format, the 706 manual sort of describes it- except that the frequency data is in BCD and is sent ass backwards least significant byte first.

The way I figured out what my 706 was doing was to set the serial speed to a known baud rate and hook up a serial monitor. With the 706 Mk II at least, every time you change frequency it spits out update information on the serial port.

[end of Bob's message]

So I still can't understand the high prices (well, I can, really, but I don't like them :-) but I can certainly homebrew myself a TTL-to-RS232 level translator.

From: burch@netline.net (Burch Akin)
Subject: Icom IC-756 vs. Yaesu FT-920

Thought I would throw in my 2 cents on the Icom IC-756 vs. Yaesu FT-920 debate. I recently bought a FT-920 (only had it a little over a week) and so far I love it. I live in an area with alot of powerline noise. The noise blanker on the 920 is great. Takes out almost all of my powerline noise. I can't comment on the IC-756 since I have never used one. There is a good review on the FT-920 at:

http://user.itl.net/~equinox/ft920.html

The author of the article did state that he thought the noise reduction system on the FT-920 was better than the IC-756. Most of

the article talks about the 6 meter operation of the radio.

Subject: INFO Needed: Kenwoodm430

> Is there something known as TS430 by Kenwood?
> My brother just bought a boat with a Kenwood 430 listed on inventory.

The TS-430 is a High Frequency amateur radio transceiver. With a suitable antenna, that radio will allow contact with other amateurs world wide. An amateur radio license is required to operate the radio; you earn such a license by passing a test on radio theory, regulations, and procedures, and in most cases morse code.

Hi Mark:

I am not familiar with the TS430S. I did not find any info at the
Kenwood website for that model.
Can you tell me if that radio includes internal ant tuner? VOX ?
CW/SSB filters ?

My brother just bought a boat that includes a Kenwood 430 and I would
like to know more about it. I might be operating WA2RSX /mm from
west coast to east coast via Panama Canal.

Pse Email info to wa2rsx@worldnet.att.net

Subject: VX-1R firmware BAD!!

I will try that and let you know
A10x , anyway, The firmware is ok only on ham bands and Japan's
Public Service Band.

I hope with the AMDS programming that Tone Squelch can be
programmed in for the 470-800 Mhz and
170-222Mhz regions.

It accepts Tone squelch in receive for 380-420
, 420-470, and 800-999.

Also the save function to prolong battery life
does not work in the 470-800 and 170-222 segments.

Should like YAESU DID IT AGAIN as they say in their
advertizements!!! screwed up again , like the mailbox
and DVR and the FT-50R.

No Quality Control, No Critical Design Review
Process in debug problems.

Actually the "HOME" channel can be changed. I have changed mine to
146.52 and 446.00 respectively. You just have to make the "PRI" channel
another memory channel FIRST, as the "PRI" channel cannot be changed.

>
The receiver offset is about 800 Hz. I " zero beat " by merely
adjusting the s-meter to highest reading on the received signal. Once
set up a 735 and a service monitor. set the service monitor to 14.100
MHz and started generation. Tuned the 735 to " zero beat ", no tone
in the speaker, transmitted and found the 735 to be setting at
14.100. Could not be any easier if you bought it at Sears.

So if you peak the received signal you will be " zero beat " All
ICOM's react this way also.

...snip...
> I particularly like the tunable DSP and the tunable notch filter. I also
> have the narrow CW (500hz) filter, and awaiting the FM module
> (backordered).

Sorry that you had to pay extra money to get FM. I really do not have
a good feeling for how useful (frequently I'd use) FM on HF. Probably
only on 6m and maybe 10m and I think the yaesu idea of FM being extra
is a good one if the price came down in response. It appears, however,
that the rig is still priced high (like the Icom) and only goes higher.
I think the noise reduction DSP processing on the 756 works extremely
well. This is a feature I use ALL the time. The dual pass band tuning
is another which I use all the time. I wonder why anyone would buy
the expensive, traditional plug-in filters.

>
> My biggest reason for the purchase of the 920 over the 756 was that I
> thought the display of the 756 looked too confusing and not as straight

> forward (maybe due to past experience) as the 920.. While I'm sure that

OH, NO! The display, menu system and general layout of the knobs and
buttons is very straight forward on the 756 and easy to use (notice I
did not say learn). If you know anything about modern (post 1970's)
radios, you should be able to figure things out in very short order just
by looking at the front panel - without the manual.

> one can get very proficient operating the 756, I tend to not operate for

>Thanks,
>de Conard WS4S
>ws4s@infoave.net

Look to Communications Specialists in Orange, CA for a tone encoder
module. As for tome on FM, the 251A likely has a voltage supply
labeled like FM8 which is 8 volts only when in FM mode. Hook either
the tone encoder power line or if there is an enabling line to the
source. Now the encoder will be active only when in FM mode.

>etc.) is not a problem.

All you need is a SINAD meter and a signal generator. I use an IFR1200
which combines both in one unit. Connect the SINAD meter to the radio.
Connect the signal generator to a reference antenna. Now with the computer
turned off, generate a signal and adjust the level to achieve a 12 db SINAD
reading from the radio under test. Note the dbm level of the signal generator.
Now turn the computer on. Readjust the signal generator to return the SINAD
reading to 12 db. The difference in signal generator levels between computer
on and computer off is the amount of desense you are suffering.

Note don't move the radio or the antennas during this test, and try to keep
your body in the same position so that you don't change the relative near
field relationships while doing the measurement.

From: Phil Wheeler <w7ox@ix4.ix.netcom.com>
Subject: TS-570 vs Omni V

Steve,

I can only conclude you did not have a good TS-570D sample or did not
use the NR2 position on CW.

I am a fairly "serious" (since 1953) CW operator who has had a 570D
since they were released, as is one of my friends who has a 570D. We
both love it. I also have an NIR-12 by JPS. NR1 on SSB in 570D is
inferior to JPS-NIR-12; NR2 on CW does as well or better than NIR-12.

Re "true" DSP: True DSP shold be ahead of the AGC stages. In that sense most of the audio stage DSPs are not "true" DSP. None of the outboard units (JPS, MFJ, Timewave) are likely to meet the "true" DSP definition -- but that does not meaan they are ineffective.

My big pain is those rigs (TS-870 is one example, maybe the only one) who put IF stage DSP at a low (15-20 kHZ) freq IF and then do not alow for a xtal/mech filter at RF IF stage: Those rigs can have a real problem!

BTW: I have not compared TS-570D with Omni or many other rigs. Others have and have given positive reviews. But on CW it beats the socks of my old TS-440S with JPS NIR-12 and narrow CW filter! But you must use the NR2 option; NR1 is not helpful for CW and NR2 distorts on SSB. It also helps to narrow the DSP BW for CW with NR2 (it can go as low as 50 Hz, and the sigs really pop out of the noise on my 570D -- but not with 600 Hz DSP BW).

From: wormser@osiris.cso.uiuc.edu
Subject: TS-830 Freq Jump

I had a problem with my TS-830S jumping frequency (about 100 Hz at a time)and I got lots of replies when I asked for help. Ham radio is full of a bunch of really great folks - no wonder I love this hobby! For me,cleaning the FIX button worked (yes, the "FIX" button was broken ;-)). I'm posting this to thank everyone, and to help anyone else in the same situation. All the suggestions were excellent. Alan Wormser, N5LF (ex-WB5QLF)

>From Ian G3SEK, Art N2AH, Paul K0PW, Frank KB0ZFN, and many others:

Grounding the AF/AVR board: Connecting a wire from TPG post to ground screw, and inserting star washers between board and heat sink, In accordance with Kenwood bulletin - appeared in QST Hints & Kinks in the mid-1980s.

>From Dale R. Parfitt W4OP

Although I have not seen this problem in a Kenwood, I have seen it in Icom and Yaesu- both with the same cause- small single turn variable caps. In case of the Yaesu it was a frequency netting cap on a heterodyne oscillator- drove me nuts. It occurred randomly and never when I had the rig open. A hint from another ham sent me looking in that direction. Replaced 2 or 3 and that was the end of it. Hope this helps.

>From Brian Sherrod KJ5AG

This is a common problem with the 830. This jack has a contact which is shorted WITHOUT a external VFO. If the contacts get dirty, it will do exactly as you described. You might also want to spray a small amount of

contact/electronic solvent on the jack and do the plug in and out as I mentioned before.

>From Dennis Clemenson NT0V

NOTE: This solution is also in the 1997 edition of ARRL's book,"Hints and Kinks" I had what sounds like the same problem with a TS-830S. Turned out the switch labeled "FIX" was intermittent. It is in the path of the voltage to the VFO and if it has some extra resistance, the frequency would change. I tried "Deoxit" and that worked for a while but finally I jumpered around the switch contact since I never used crystals for operating. Try operating the switch many times and see if goes away for a while.

>From John <rtwodtwo@jps.net>

Sounds like one of the xtal trimmer caps is going bad. The center pivot point is getting rusty. Contact cleaner will fix this for a month or so but you need a new one.

Subject: ADI AT-600

Right now I'm looking into buying an ADI AT-600 (dual band handheld) but
I'm a bit hesitant because the price is so low (100 -200 dollars cheaper
than average dual band HT's with fewer capabilities). Anyway, I'm just
looking to hear from anyone with any problems or comments regarding this
type of handheld and/or its manufacturer.

I believe the ADI web site is at http:\\www.adi-radio.com

Thanks,

Kerry

From: Shawnerz@xSprintmail.com (Shawn)
Subject: FS-FT: Broken ICOM 02-AT For Parts

I have an Icom 02-AT HT for sale or trade. IT DOES NOT WORK!
Problems:
Volume knob does not turn the power off

The mylar ribbon cable that interconnects the 3 PC boards together is tearing. Because of this, the PTT doesn't work, the keyboard is intermittant. I'm tired of doing repairs and I'm getting dimishing returns.

Included is 2 BP-3 battery packs and 1 (maybe two, I have to check my parts bin) final PA transistors-but NO ANTENNA. I blew a couple out several years ago before I found that you can't transmit in high power with a rubber duck antenna and a speaker mic. It's a long story, but that part is fixed.

Asking price: $40-you ship. I'm not really interested in the money, I'm more interested in what you might have to trade.

Current wants:

2 Network cards (ISA to 10base2 perfered)
220 equipmet
SCSI equipment (cards, cables, whatever-again ISA)
you name it.

Does anyone out there know of a Fix for the skipping problem
that the FT-2400's and FT-2500 have ?

You move the vfo knob and somtimes it changes freqency others
it skipps , Like 2 or 3 memory locations or the same in direct
frequency dialing.

I have not tried this yet, but I have it on good authority that you
press the function key for 1 sec, then MR when on the channel you want
to delete.

Funny that that was not in the manual! The only way I could delete
channels before was to use the ADMS software.

That gizmo is available. I believe it is the CT-44 adapter that converts the 4 pin connector of the FT-50R or the VX-1R to a dual jack setup.

Hi again, Dick.

I have both of the Yaesu models. I rarely use the FT-51R anymore, and almost ready to sell the beast. The FT-51R is a true dual band radio, with essentially two tranceivers built in one HT. It does not have 800 Mhz (at least the US version), and it does not have DCS. Many commercial services are going to DCS(digital coded squelch). The true dual band feature is good if you wish to continuously monitor two frequencies. I found it to be a pain, as when you are transmitting on one band, you may receive another signal on the other band, kind of throwing you off from your concentration. You can auto mute the other band or decrease the volume, though. In reality, I never use the unit to monitor more than one frequency at a time.

The FT-50R is less expensive and very versatile, It does have DCS and despite some limitations, is a very good scanner. It has 800/900 Mhz as well. You can only monitor one band at a time, but you can use its priority feature to check another frequency intermittently. It has 5 scan ranges. The wide band FM reception is terrible and unusable for the most part. This is my preferred HT, and it accompanies me on trips! For a full rundown on the unit, and mods (especially the super-awsome mod) check out this URL:

http://members.gnn.com/hca/ft50/index.htm

Unless dual band receive is important to you, I would definitely place the FT-50R above the FT-51R. It is a good (not excellent) scanner and an excellent ham HT. If you have to bring one unit with you on trips, you can use this one for all your needs.

I also have the new VX-1R mini dual band handheld, which is impressive in it's own right (no, I don't own stock in Yaesu) but will not completely replace the FT-50R. They did fix the FM-Wide reception, but the radio is relatively deaf in the 800/900 Mhz region.

As far as accessories, the FT-51R has a neat microphone that displays

>etc.) is not a problem.

All you need is a SINAD meter and a signal generator. I use an IFR1200
which combines both in one unit. Connect the SINAD meter to the radio.
Connect the signal generator to a reference antenna. Now with the computer
turned off, generate a signal and adjust the level to achieve a 12 db SINAD
reading from the radio under test. Note the dbm level of the signal generator.
Now turn the computer on. Readjust the signal generator to return the SINAD
reading to 12 db. The difference in signal generator levels between computer
on and computer off is the amount of desense you are suffering.

Note don't move the radio or the antennas during this test, and try to keep
your body in the same position so that you don't change the relative near
field relationships while doing the measurement.

From: Phil Wheeler <w7ox@ix4.ix.netcom.com>
Subject: TS-570 vs Omni V

Steve,

I can only conclude you did not have a good TS-570D sample or did not
use the NR2 position on CW.

I am a fairly "serious" (since 1953) CW operator who has had a 570D
since they were released, as is one of my friends who has a 570D. We
both love it. I also have an NIR-12 by JPS. NR1 on SSB in 570D is
inferior to JPS-NIR-12; NR2 on CW does as well or better than NIR-12.

Re "true" DSP: True DSP shold be ahead of the AGC stages. In that
sense most of the audio stage DSPs are not "true" DSP. None of the
outboard units (JPS, MFJ, Timewave) are likely to meet the "true" DSP
definition -- but that does not meaan they are ineffective.

My big pain is those rigs (TS-870 is one example, maybe the only one) who put IF stage DSP at a low (15-20 kHZ) freq IF and then do not alow for a xtal/mech filter at RF IF stage: Those rigs can have a real problem!

BTW: I have not compared TS-570D with Omni or many other rigs. Others have and have given positive reviews. But on CW it beats the socks of my old TS-440S with JPS NIR-12 and narrow CW filter! But you must use the NR2 option; NR1 is not helpful for CW and NR2 distorts on SSB. It also helps to narrow the DSP BW for CW with NR2 (it can go as low as 50 Hz, and the sigs really pop out of the noise on my 570D -- but not with 600 Hz DSP BW).

From: wormser@osiris.cso.uiuc.edu
Subject: TS-830 Freq Jump

I had a problem with my TS-830S jumping frequency (about 100 Hz at a time)and I got lots of replies when I asked for help. Ham radio is full of a bunch of really great folks - no wonder I love this hobby! For me,cleaning the FIX button worked (yes, the "FIX" button was broken ;-)). I'm posting this to thank everyone, and to help anyone else in the same situation. All the suggestions were excellent. Alan Wormser, N5LF (ex-WB5QLF)

>From Ian G3SEK, Art N2AH, Paul K0PW, Frank KB0ZFN, and many others:

Grounding the AF/AVR board: Connecting a wire from TPG post to ground screw, and inserting star washers between board and heat sink, In accordance with Kenwood bulletin - appeared in QST Hints & Kinks in the mid-1980s.

>From Dale R. Parfitt W4OP

Although I have not seen this problem in a Kenwood, I have seen it in Icom and Yaesu- both with the same cause- small single turn variable caps. In case of the Yaesu it was a frequency netting cap on a heterodyne oscillator- drove me nuts. It occurred randomly and never when I had the rig open. A hint from another ham sent me looking in that direction. Replaced 2 or 3 and that was the end of it. Hope this helps.

>From Brian Sherrod KJ5AG

This is a common problem with the 830. This jack has a contact which is shorted WITHOUT a external VFO. If the contacts get dirty, it will do exactly as you described. You might also want to spray a small amount of contact/electronic solvent on the jack and do the plug in and out as I mentioned before.

>From Dennis Clemenson NT0V

NOTE: This solution is also in the 1997 edition of ARRL's book,"Hints and Kinks" I had what sounds like the same problem with a TS-830S. Turned out the switch labeled "FIX" was intermittent. It is in the path of the voltage to the VFO and if it has some extra resistance, the frequency would change. I tried "Deoxit" and that worked for a while but finally I jumpered around the switch contact since I never used crystals for operating. Try operating the switch many times and see if goes away for a while.

>From John <rtwodtwo@jps.net>

Sounds like one of the xtal trimmer caps is going bad. The center pivot point is getting rusty. Contact cleaner will fix this for a month or so but you need a new one.

From: dddavis@atl.mindspring.com (Donald D. Davis, Jr.)
Subject: crossband

The FT5100 does have crossband repeat with no mod required. I think this radio is especially good for crossband because you can combine DTMF code squelch functionality with the crossband function to prevent accidental triggering by other stations.

best of luck, Don (KE4KYO)

From: mwilson@flex.net (Monty Wilson)
Subject: IC-2000H memory corruption

I have programmed several memory channels' information
into this 2m rig, an Icom IC-2000H. Frequency, offset, tone
frequency and mode, alphanumeric channel names. They
are supposed to be stored in nonvolatile memory, and that
appears to be happening OK. But about once a month, the
radio, when you turn it on, flashes ICOM on the display for
a second then turns itself off. The radio manual says when
that happens, it means that the nonvolatile memory has been
corrupted, and gives directions for a master reset of the system.
In every case, this master reset has cleared up the problem but
of course means you must go through all the programming again.

Has anyone experienced similar problems? Please let me know.

.........Monty N5NVM.

I had the same problem. I found that I forgot to shut the radio off when
I tuned on the ignition. Evidently, there is a voltage spike that can
do damage to your radio if you don't have it off when you start your
car.

From: djeo1@mail.telis.org
Subject: "HELP!!!" Noise in Kenwood TM-631A

I need help on my 2m/220

I run my radio mobile with it connected directly to the battery. I
have owned the radio for about six years now and never had a problem. About
2 months ago I started to lose stored memory. So I changed the lithium
battery. It did not cure the problem, however I ended up with another one.

When I tune the radio on 2m (in main band) to a fixed station (i.e.
NOAA) I get noise in the foreground and I can hear NOAA in the background.
When I do a band band change (220 now in main band and 2m in sub-band) NOAA
signal comes in clear. When I switch back to 2m in main band, everthing works
properly from there on as long as I keep the radio on. When I turn the radio
off, then turn it back on, the same problem occurs. I checked very closely to
the circuit where I soldered the battery to see for any circuit damage had
occured or if I lifted any traces. Everything looks fine. In fact changing the
battery was a very easy proceedure. I have checked wires and all.

Does anybody have a clue as to the problem? Any response will be
appreciated. Please respond to

djeo1@mail.telis.org

Thanks

>-Jim

I tried that *once*. I wasn't very happy. You've got a tangle of wires
to deal with (coax, power, external mike, external speaker, etc), and HT
audio is still inferior to what you get with a mobile. I also didn't like the
idea
of constantly connecting and disconnecting the antenna connector on the HT.
Those connectors aren't intended for that, and they wear out quickly. Plus
even a good HT will have a much greater tendency to overload and suffer
IMD than will most mobile rigs. I think it is better to reserve the HT for
HT type things and get a real mobile rig to permanently mount in the
vehicle.

Subject: ICOM 735 Remote Serial Port - HELP!

I would like to connect my 735 to my computer.
I am real comfortable with RS232 but I have no
documentation on the IC-735's protocol. I do know
it's a 1200 baud port with only one line in and that
it requires a little additional circuitry to bring
up. Has anybody used this port?

Thanks in advance.

>thanks in advance.

The place for the low pass filter is at the amplifier output. The amp will
always
be dirtier than the transceiver. Bond the filter to the amplifier case, and
make
sure the amplifier is well bonded to station ground. The transceiver needs to
be
bonded to station ground too, via a separate ground cable, and not daisy
chained
to ground via the amplifier. Doing the latter can induce RF feedback.

From: Steve Ellington <n4lq@iglou.com>
Subject: Speaker Tip

I picked up a new MFJ ClearTone speaker model mfj-281 at the hamfest.
This thing is amazing! CW sounds clearer and louder than with any
speaker I've tried so far and I've tried many. It's only 3" square, has
a mounting bracket and cost a whopping $10. I've put my big speakers in
the closet for now. This speaker was designed for ssb and sounds great
in that mode too. Copy through qrn is much better now.

Hello,

I don't want to seem to be overly critical but I think you
logic needs refinement.

the situation you describe above would be normal under normal
conditions. That is to say that statistically the radio would land on
one or the other memory location 50% of the time, just the same odds
as flipping a coin.

In so far as the PL is concerned, you are making some
assumptions that may not be valid. first of all lets assume that the
repeater or station your listening to stays on the air.. You would
expect that the radio would open squelch when it moves to the correct
memory with the proper PL.

However, your possible mistake is that you are assuming that
the station you have choosen is transmitting a PL tone.
------> MOST, IF NOT THE MAJORITY <------- of amateur repeaters
utilize a PL tone on receive BUT usually ---> DO NOT <--- transmit a
PL tone.

Therefore, your hyposis is faulty in that the radio would not
open squelch on the correct memory location.

In the commercial two-way world they do transmit PL tone,
however, it is usually setup so that the tone gets dropped at the same
instance the input signal goes away. BUT !!!!! The commercial
repeater transmitter still stays on the air for a brief period of time
after the PL is dropped to simulate an older system of "REVERSE BURST"
used when mechanically resonate reeds were the detection process for
PL tones. The reverse burst would switch the phase of the PL tone by
180 degrees and was used to stop the reed so that the receiving
station speaker would cut off before the transmitter and thereby the
operator would not here the harsh closing of the squelch circuit.

I hope that helps you with understanding what otherwise would
appear to be a flaw in the equipment ??? This subject is covered in

various books and manuals, one of which is the ARRL HANDBOOK.

Good luck on getting into amateur radio, it can be and is a
rewarding experience allowing for advancement in the arts of speech
and communication with a variety of peoples accross the planet and
providing an environment in which one's curiosity is triggered into
learning in many of the diverse fields that make up the hobby.

> K6KME

This won't work! The tone burst is audible and goes through the mic BPF,
low end roll off is around 400Hz, which will almost knock out the PL
completely.

Sorry :-(

: W1 and W2. What are they doing?
: Because I don't have any manual, can anyone give me a short description on
: the key combinations?

The cables (wires?) exist in the US "a" version. However, there isn't
a diode at 14 or 15. Also, the keys near PTT are PPT, Light, and Monitor.

I understand the "e" version has a "tone" key in replacement. Also,
thought I don't have my stuff with me right now, I believe that the
transmitting range is a little different.

I'll tell you after I get home and read the book.

From: Steve Ellington <n4lq@iglou.com>
Subject: TS-570 vs Omni V

A Kenwood TS-570 has been the guest of my shack for the past week. I spent many hours and dozens of QSOs comparing the two rigs and feel a need to report my findings to the TenTec crowd.

The TS-570 is Kenwood's most modern rig. It's computer interface is second to none running at 57.6kb through a 9pin serial port directly to the pc.
Rig control software was available through their Webb page and performance in that area was awsome. Every button, knob and display was controlable bi-directional. I was impressed.

Kenwood makes claim to "incredibly clear and powerful audio". However their manual specifies 1.5 watts at 10% distortion. Hardly what I would call incredible. SSB and AM sounded quite good but cw was terribly distorted at low volume levels using an 8 ohm speaker or headphones.

Being a cw operator, I look at a radio somewhat differently than the average phone operator. I'm interested in the clarity and purity of the recieved cw tone, proper agc response to qrn, narrow filter performance, full break-in capabilities and of course a good transmit tone.

Concerning transmitt, the TS-570's tone was reported by all to be excellent but somewhat softer than the Omni. Under weak signal conditions, switching to the Omni in mid qso resulted in such comments as "sounds like you turned on the amp", cpy better now om etc.

QSK on the 570 was fairly smooth and quite but relatively slow. I ran what I call the "dit busting test". Another stations tries to break me while I'm sending a string of dits. I sent a string of dits at 25 wpm. I was never able to hear the other station breaking. This test was duck soup for the old Omni V.

The TS-570 is advertised as a "DSP radio". This is totally incorrect. A true DSP radio uses dsp technology from the front-end to the audio amplifier. No coils or transformers are needed in the R.F. chain. Such receivers are available from Collins for about $16,000. The DSP in the 570 is simply a dsp unit between audio stages and offers less flexiblity than outboard units such as the MFJ or Timewave.

So here we are on 80 meters at night with S9 static trying to work another station who is also S9, a tough test for any radio. I had installed the 500hz filter in the 570. There is only 1 slot for extra filters. The Omni V has the 500, 250 plus the extra 500hz filter. Contact was estabilised but copy on the 570 was difficult. I kicked in the 500hz filter which automatically kicks in a 600hz dsp filter. Noise level from the qrn increased considerably and copy was impossible. Yes, Kenwoods filters tend to boost qrn! I then pushed the N.R. button. This is supposed to eliminate such noise. This resulted in sound resembling

something from a horror movie. Howling, chattering and muttering sounds eminated from the speaker with an occasional cw note poping through in a broken, unreadable manner. I had to switch to the Omni V quick to see if I co

Hello,

I don't want to seem to be overly critical but I think you
logic needs refinement.

the situation you describe above would be normal under normal
conditions. That is to say that statistically the radio would land on
one or the other memory location 50% of the time, just the same odds
as flipping a coin.

In so far as the PL is concerned, you are making some
assumptions that may not be valid. first of all lets assume that the
repeater or station your listening to stays on the air.. You would
expect that the radio would open squelch when it moves to the correct
memory with the proper PL.

However, your possible mistake is that you are assuming that
the station you have choosen is transmitting a PL tone.
------> MOST, IF NOT THE MAJORITY <------- of amateur repeaters
utilize a PL tone on receive BUT usually ---> DO NOT <--- transmit a
PL tone.

Therefore, your hyposis is faulty in that the radio would not
open squelch on the correct memory location.

In the commercial two-way world they do transmit PL tone,
however, it is usually setup so that the tone gets dropped at the same
instance the input signal goes away. BUT !!!!! The commercial
repeater transmitter still stays on the air for a brief period of time
after the PL is dropped to simulate an older system of "REVERSE BURST"
used when mechanically resonate reeds were the detection process for
PL tones. The reverse burst would switch the phase of the PL tone by
180 degrees and was used to stop the reed so that the receiving
station speaker would cut off before the transmitter and thereby the
operator would not here the harsh closing of the squelch circuit.

I hope that helps you with understanding what otherwise would
appear to be a flaw in the equipment ??? This subject is covered in
various books and manuals, one of which is the ARRL HANDBOOK.

Good luck on getting into amateur radio, it can be and is a
rewarding experience allowing for advancement in the arts of speech
and communication with a variety of peoples accross the planet and
providing an environment in which one's curiosity is triggered into
learning in many of the diverse fields that make up the hobby.

This won't work! The tone burst is audible and goes through the mic BPF,
low end roll off is around 400Hz, which will almost knock out the PL
completely.

Sorry :-(

Subject: What is a good starter 2m/70cm HT? (used or new)

Just getting started and I am curious what would be a good 2m/70cm handheld to purchase. I would prefer to spend around $300 and would not mind getting used hardware.

I've tried to check this newsgroup, and the web, but I'm having a hard time finding anything other than supplier advertising, forsales, or modification info.

Anyone have any input, or websites with critical reviews I could check out?

Thanks for the help!

Notice how Jimmie is cleaning up his act. He is TRUELY running scared,
just like a third grade playground bully. No more threats, and thank God,
no more long dissertations about other guy's "balls."

He has also been pretty busy cancelling the messages that illustrate his
worst behavior. Guess he doesn't know that they are still accessible
within DejaNews.

And now, get this, he's complaining to other folk's ISP's that he is an
"innocent victim." The big bad bully *always* tells mommie he is being
picked on.

He is so delusional he thinks someone actually CARES !

> AND 470-800mHZ("UHF TV)".
> The radio can activated Tone, Tone Squelch, DCS in all the
> other bands.

That sounds perfectly reasonable, since those tone squelch
systems are not used on VHF TV or UHF TV ... now, to be fair
there may be some 470-512 Land Mobile stuff in your area, if
you're in one of the major urban areas, but you're not supposed
to be transmitting in any of those bands (even if you're licensed
in another service) since Yaesu's radio is not "type accepted"
for the commercial services ...

> Trying to listening to our Fire Dept, and other Systems
> that use Tone Squelch, get some Intermod, so must need
> Tone Squelch on receive to use in my area.

Tone squelch will not make the intermod go away ...

> Anyone else notice this, why can't Yaesu fix the firmware
> flaws, before releasing a radio.

Doesn't sound like a "flaw" to me ... sounds like they intended
it that way ...

> If Yaesu can't fix, I returning it to the retailer!!

Good luck finding a scanner that will cover those bands that
will support those tone squelch systems ...

> I hope others will notice and call Yaesu to fix this asap
> in their firmware, 5 other hams with the new VX1R noticed
> this and were upset that it seems these Radio manufacturers
> release 1st generation radio's with bugs.

>
> It's funny in less than 1 hour, I find a bug, don't they
> (Yaesu) ring out their radio's for bugs!!!
>
> Mike

Again ... while I understand that you think the radio should do
something it apparently doesn't, that doesn't necessarily make
it a "bug" or a "design flaw" ... it seems perfectly reasonable to
assume that Yaesu never intended that tone squelch function
in the 170-222 and 470-800 MHz bands, since it's hardly ever
used there and you're only supposed to be listening there anyway.

Turn on the radio
Setup both bands the way you desire
Press and hold both main band buttons and set button all at the same
time until the memory channels are a flashing " L " . The radio is
now in crossband repeater.
Press and hold the set button to revert to normal.

Gary

Heathkit Radios for sale!

I have four (4) radios for sale. Two are close to
working, 2 I havn't been able to get anything to happen.

SB-101 All tubes. Cosmetically good. 400 kc CW filter.

SB-101 All tubes. Very clean. 400 kc CW filter
Some audio & Receive. No Xmit.
I think this one just needs a good tune-up.

HW-101 All tubes. Very clean. 400 kc CW filter.
Receives but need tuning.
Transmits but needs tuning.
This may be the best one of the bunch.

HW-101 Most tubes. Seen better days. No filter
Havn't even tried to get this one going.

One HP-23 and Two HP23A power supplies.

Box of spare LMO's, feet, dial parts, tubes, etc.

I'm selling all of above as package for $100.00 plus
shipping. The CW filters I know alone have been going
for $40-$50 each on the used market.

If intrested, please contact Shane, WB2WPM at:

(716) 675-5797
or sbrady@pce.net
or wb2wpm @ke2vw.#wny.ny.usa.na

I'm located outside of Buffalo, New York.

If your a fixer-upper and good with tubes radio's I
know you'll be able to get 2 of these up and running
in no time. The other 2 maybe too.

Thanks for reading, and hope to hear from you.

>Any info on the FT-530 vs the FT-50 will be appreciated

Jeff,

Two totally different radios. The FT-530 is a "true" dual band radio...in that it is capable of full-duplex and simultaneous receive on both of two receivers. The FT-50 is a "twin" band radio..thus capable of receiving only one frequency at a time of different bands. No full duplex etc. Both are very impressive radios in their own rights but I could not compare one to the other without taking into consideration each is in a class by itself.

Nit

the operating frequency. That is an excellent feature. The FT-50R has
a miniature plug with 4 conductors. You can get a lapel mic/speaker or
an earphone/ptt/mic combo for the HT. You can also use these on the
VX-1R.
Programming software (ADMS) is available for both the FT-51R and the
FT-50R, and it is a windows program. It comes with a computer
interface. It was originally developed by RT systems in Alabama.

The fast charger for both is the NC-50. You buy separate inserts for
each Yaesu handheld you use, Two inserts come in each package, so if
you have only one handheld, you can charge a spare battery pack also. I
use mine for both the FT-51R and the FT-50R.

Battery packs are plentiful for both. For the FT-50R, MAHA has a NiMH 9.6 V/900 mAH battery pack (high power) and a 7.2 V/1800 mAH battery pack. There is a good selection of NiCds from Yaesu and other distributors as well.

I have found the Yaesu radios to be very intuitive to use. I have a Kenwood mobile rig, and I need to keep the manual in the car. I also had an ICOM handheld, and had to keep the manual close as well.

Hope this helps, and not too long-winded. All comments are IMHO!

From: mrusso@hoflink.comNO.JUNKMAIL (Mark Russo)
Subject: LOOKING to TRADE

Hi all, I have a Kenwood TH-78A dual band Handi talkie that I'd like
to trade. It has 3 battery packs. One is 12 volts at 800ma, one is
12 volt at 700ma and the last is 7.2 volts at 800ma. ALL the packs
are in very good condition, the 12@800 and 7.2@800 are not even a year
old. The radio is an 8.5 - 9 out of 10. It is in excellent working
condition. It also has the mods done. It also comes with the manual
and a W&W charging CUP, NO CHARGER. I use the W&W charger
for another radio. I bought the radio without a charger.

I'd like to trade for an older 2 meter all mode rig with a digital
display and PL. It must be nice looking and good working
order. I'd like a base unit but would consider a mobile.
I will pay cash to balance the deal if needed.
What do you have??

NOTE It is only legal to transmit with this radio in the
Amateur band. Don't risk your license

NOTE If you want to E-mail me, you MUST REMOVE the NO.JUNKMAIL
in my address. It should read: mrusso@hoflink.com I'm trying to stop
the unwanted Junk Mail. SORRY for the inconvenience but it's getting
out of hand.

I can't understand why the manufacturers don't have a team of Hams try the radio out to "DEBUG IT". It seems that anyone who buys a new Ham Radio when it is released is the "ALFA TESTER" without knowing it. He also is paying top $$$$ to be the first guy on the block to get the radio.

There are two types of people in this world:
1. Those that must be the "first on the block" to have a new product, and
2. Those that wait a while to let the experiences of #1 work the bugs out of product.
True of ham gear, cars, etc.

* Continuation 1 of a split message *

a miniature plug with 4 conductors. You can get a lapel mic/speaker or
an earphone/ptt/mic combo for the HT. You can also use these on the
VX-1R.
Programming software (ADMS) is available for both the FT-51R and the
FT-50R, and it is a windows program. It comes with a computer
interface. It was originally developed by RT systems in Alabama.

The fast charger for both is the NC-50. You buy separate inserts for
each Yaesu handheld you use, Two inserts come in each package, so if
you have only one handheld, you can charge a spare battery pack also. I
use mine for both the FT-51R and the FT-50R.

Battery packs are plentiful for both. For the FT-50R, MAHA has a NiMH 9.6 V/900 mAH battery pack (high power) and a 7.2 V/1800 mAH battery pack. There is a good selection of NiCds from Yaesu and other distributors as well.

I have found the Yaesu radios to be very intuitive to use. I have a Kenwood mobile rig, and I need to keep the manual in the car. I also had an ICOM handheld, and had to keep the manual close as well.

Hope this helps, and not too long-winded. All comments are IMHO!

Subject: icom 2350h dual band

greetings,

i have performed two mods to my 2350h that involve d8 , d9 and w1 jumper .
according to my service info sheet there are two MORE mods which can be done by (i assume) removing two more diodes . i have done this but the rig acts no different than before . the service sheet has a couple of lines blacked
out so i can't read them . does anyone know the function of these additional
mods ? do i need to do some 'magic' keystrokes on the front panel to activate them ?

thanks in advance

Subject: Icom IC756 any comments on this radio??

Hi there

I am thinking of buying an IC756 as a complete answer to HF & 6M ....should I ???? I hope to gain my Novice licence soon and would like to only buy a HF rig once! Any suggestions would be appreciated (pro's & con's etc.)

thanks
allan@ruralnet.net.au

From: mrusso@hoflink.comNO.JUNKMAIL (Mark Russo)
Subject: LOOKING to TRADE

Hi all, I have a Kenwood TH-78A dual band Handi talkie that I'd like
to trade. It has 3 battery packs. One is 12 volts at 800ma, one is
12 volt at 700ma and the last is 7.2 volts at 800ma. ALL the packs
are in very good condition, the 12@800 and 7.2@800 are not even a year
old. The radio is an 8.5 - 9 out of 10. It is in excellent working
condition. It also has the mods done. It also comes with the manual
and a W&W charging CUP, NO CHARGER. I use the W&W charger
for another radio. I bought the radio without a charger.

I'd like to trade for an older 2 meter all mode rig with a digital
display and PL. It must be nice looking and good working
order. I'd like a base unit but would consider a mobile.
I will pay cash to balance the deal if needed.
What do you have??

NOTE It is only legal to transmit with this radio in the
Amateur band. Don't risk your license

NOTE If you want to E-mail me, you MUST REMOVE the NO.JUNKMAIL
in my address. It should read: mrusso@hoflink.com I'm trying to stop
the unwanted Junk Mail. SORRY for the inconvenience but it's getting
out of hand.

I can't understand why the manufacturers don't have a team of Hams try the radio out to "DEBUG IT". It seems that anyone who buys a new Ham Radio when it is released is the "ALFA TESTER" without knowing it. He also is paying top $$$$ to be the first guy on the block to get the radio.

There are two types of people in this world:
1. Those that must be the "first on the block" to have a new product, and
2. Those that wait a while to let the experiences of #1 work the bugs out of product.
True of ham gear, cars, etc.

From: yrplace@earthlink.net (Mark Linett)
Subject: WTB- PRO-AUDIO EQPT

I am interested in purchasing all kinds of compressor/ amplifiers, older microphones, mic preamps,mic mixers and other professional broadcast and recording equipment for my collection and recording studio.

Loking for Turner model 77 and 87 microphones, Sennheiser model 409 mics

Brands such as Neumann, AKG, Telefunken, UREI, Teletronix, Altec etc.

Especially interested in anything by Langevin and RCA.

The older the better, and basket cases are always welcome.

Thanks in advance.

Notice how Jimmie is cleaning up his act. He is TRUELY running scared,
just like a third grade playground bully. No more threats, and thank God,
no more long dissertations about other guy's "balls."

He has also been pretty busy cancelling the messages that illustrate his
worst behavior. Guess he doesn't know that they are still accessible
within DejaNews.

And now, get this, he's complaining to other folk's ISP's that he is an
"innocent victim." The big bad bully *always* tells mommie he is being
picked on.

He is so delusional he thinks someone actually CARES !

That sounds perfectly reasonable, since those tone squelch
systems are not used on VHF TV or UHF TV ... now, to be fair
there may be some 470-512 Land Mobile stuff in your area, if
you're in one of the major urban areas, but you're not supposed
to be transmitting in any of those bands (even if you're licensed
in another service) since Yaesu's radio is not "type accepted"
for the commercial services ...

> Trying to listening to our Fire Dept, and other Systems
> that use Tone Squelch, get some Intermod, so must need
> Tone Squelch on receive to use in my area.

Tone squelch will not make the intermod go away ...

> Anyone else notice this, why can't Yaesu fix the firmware
> flaws, before releasing a radio.

Doesn't sound like a "flaw" to me ... sounds like they intended
it that way ...

> If Yaesu can't fix, I returning it to the retailer!!

Good luck finding a scanner that will cover those bands that
will support those tone squelch systems ...

> I hope others will notice and call Yaesu to fix this asap

Again ... while I understand that you think the radio should do
something it apparently doesn't, that doesn't necessarily make
it a "bug" or a "design flaw" ... it seems perfectly reasonable to
assume that Yaesu never intended that tone squelch function
in the 170-222 and 470-800 MHz bands, since it's hardly ever
used there and you're only supposed to be listening there anyway.

Turn on the radio
Setup both bands the way you desire
Press and hold both main band buttons and set button all at the same
time until the memory channels are a flashing " L " . The radio is
now in crossband repeater.
Press and hold the set button to revert to normal.

Heathkit Radios for sale!

I have four (4) radios for sale. Two are close to
working, 2 I havn't been able to get anything to happen.

SB-101 All tubes. Cosmetically good. 400 kc CW filter.

SB-101 All tubes. Very clean. 400 kc CW filter
Some audio & Receive. No Xmit.
I think this one just needs a good tune-up.

HW-101 All tubes. Very clean. 400 kc CW filter.
Receives but need tuning.
Transmits but needs tuning.
This may be the best one of the bunch.

HW-101 Most tubes. Seen better days. No filter
Havn't even tried to get this one going.

One HP-23 and Two HP23A power supplies.

Box of spare LMO's, feet, dial parts, tubes, etc.

I'm selling all of above as package for $100.00 plus
shipping. The CW filters I know alone have been going
for $40-$50 each on the used market.

If intrested, please contact Shane, WB2WPM at:

(716) 675-5797
or sbrady@pce.net
or wb2wpm @ke2vw.#wny.ny.usa.na

I'm located outside of Buffalo, New York.

If your a fixer-upper and good with tubes radio's I
know you'll be able to get 2 of these up and running
in no time. The other 2 maybe too.

Thanks for reading, and hope to hear from you.

73, Shane WB2WPM

Subject: FT-50 owners, how to stop accidental power on?

I just bought an FT-50 and the slightest touch (not 1/2 second like the manual says!) turns it on. If it falls over, it turns on. I'm afraid it's gonna turn on in a pocket, in the glove compartment, etc. Any suggestions?

Thanks,
RonL

>Any info on the FT-530 vs the FT-50 will be appreciated

Jeff,

Two totally different radios. The FT-530 is a "true" dual band radio...in that it is capable of full-duplex and simultaneous receive on both of two receivers. The FT-50 is a "twin" band radio..thus capable of receiving only one frequency at a time of different bands. No full duplex etc. Both are very impressive radios in their own rights but I could not compare one to the other without taking into consideration each is in a class by itself.

From: Thomas Gasta <tomgasta@worldnet.att.net>
Subject: Beware!! Firmware Flaws in New Yaesu VX-1R Mini_HT Don't Buy yet!!

I didn't see where the gentleman ever stated that he wanted "to
transmit" anywhere. In fact, he clearly indicates that he wants to use
the radio to receive. In many parts of the Country, and in other parts
of the world, the 470-520 band is heavily used.

Secondly, the same goes for the 170-174 portion of the "VHF-TV" band. US
Government uses a lot of spectrum in that 4 Mhz.

CTCSS and DCS is common in all of the operations. And yes, PL/DPL does
not eliminate intermod, but, it most certainly does eliminate most of
the noise coming out of the speaker that is associated with it.

The radio, however cute, has flaws. The radio is advertised with
features it simply does not have. The FT50 was originally advertised as
capable of wide band FM for broadcast reception, which was hardly even
half true. The VX-1 is advertised as being 1 watt with the external
power adapter, yet the "errata" sheet that comes with the manual says:

"However, transmission in this configuration may result in some amount
of extraneous hum and noise being transmitted... we recommend that you
transmit...only in an emergency." Can you find this little minor
confession in the radios advertisements?? No you can't, this is one of
them little flaws Yaesu is so proud of hiding and hoping that it won't
be found out. Also, has anyone yet figured out the "290" memory channel

BS?

If you want a 1/2 watt radio that transmits and receives in the 2 meter
band and part of the UHF ham bands, then you came to the right place.
Anything else may be vaporware and should not be considered a plus prior
to purchasing until you have determined the actual abilities of the
radio.

Tom

Subject: Beware!! Firmware Flaws in New Yaesu VX-1R Mini_HT Don't Buy yet!!

Carl,
The radio is being adertized as a broad band receiver from 80-999Mhz
with Tone Squelch Receive, and that does not work in the 470-800Mhz,
and the battery saver mode does not work in the 170-222Mhz and
470-800Mhz area's.
Would you buy a car, if only 6 of the 8 spark plugs
only worked.

I use this as a receiver in Tone Squelch and Yaesu can easily fix
it if it get's enough bad press on these bugs.

So again, would you buy a car that only 6 of the 8 cylinders
were working??

From: <tnic@IDT.NET>
Subject: FT50-R VOX Recommendations??

I could use a VOX set up for my FT-50R. I tried the NIMA VOX mike and did
not like it.

Yaesu makes the VC-22 Headset which has an over the head wire big ear pad
and mike boom. It looks to me like this is a bit larger than it needs be.

Anyone know of a simple ear bud with a mike boom thats VOX and small?

It makes no sense to me to have a small radio and a big headset.

PS: The Yaesu connector for the FT-50is a single jack affair rather than
the dual prong like most radios. I would prefer the single jack to an
adapter gizmo.

Thanks & 73

Subject: how connect a bencher paddle to a keyer?

A year or so ago I purchased a bencher paddle and the econo box
keyer from MFJ. Time has passed, and I have lost the instructions on
how to connect the two. Can someone please give me instructions?

There are three connectors on the bottom of the bencher. One for each
paddle, and one for the post which the spring runs around.

The MFJ box accepts the 1/4" phone plug from the paddle.

Do I need a stereo plug to attach the paddle to the keyer? And is the left
paddle for the dit or the dah?

thanks,
robert ellis

From: "Peter Shintani" <shintani@tv.sony.co.jp>
Subject: seeking advice, which rx mod is the right one for the IC-706

Hi:
Thanks for reading this posting.
I am a little confused as to which is the correct
mod for improving the sensitivity of the VHF RX
on the IC-706.
1) "yellow" wire mod
2) 1) plus re-attaching the "yellow" wire to the appropriate SMD tr
3) removing C153 and C53 on the PA board

I seem to have come across three differnt mod's and I am not too
sure of the various trade offs of the three mods. My understanding
is the 2) is better than 1) but I don't know whether 2) is better than 3)
I tried to look up previous mod data on this subject via Dejanews, but
I could only find comments on 1) and 2) and no comparison with 3)

| |
| Mail generated on your system for a destination within the |
| 'z2.fidonet.org'-domain, was detected at this site and classified as |
| unwanted. |
| |
| If you bona-fide responded to a listserver your message unfortunately |
| also falls under that category as such type of mail is not accepted |
| nor distributed from here either. |
| |
| 'fidonet.org' is a hobby domain where individual |
| people run individual mailers using PSTN-technology out of their own |
| pocket and every such message adds to the cost. |
| |
| Therfore the original message is bounced back to you at the gate. |
| |
| Fidonet-participants are victimised by thousands of bogus listserver- |
| subscriptions and you may very well be a side-victim of this. |
| |
| In that case your cooperation would be greatly valued by crossposting |
| this mail to the postmaster/owner of the mailing-list/list-server with |
| a request to kick any subscription coming the 'z2.fidonet.org'-domain. |
| We are bothered here by it as much as you are now. |
| |
| If you are residing in the USA then the following notice |
| may apply to you. Please read it attentively! |
| |
| +-------------------------------------------------------------+ |
| | By US Code Title 47, Sec. 227(a)(2)(B), a computer/modem | |
| | /printer meets the definition of a telephone fax/machine. | |
| | By Sec. 227(b)(1)(C), it is unlawful to send any unsolicited | |
| | materials to such equipment. | |
| | | |
| | By Sec.227(b)(3)(C), a violation of the aforementioned | |
| | section is punishable by action to recover actual monetary | |
| | loss, or $500, whichever is greater, for each violation. | |
| | | |
| | I will report any violation 'abuse@postoffice.us'. | |
| +-------------------------------------------------------------+ |
| |
| Kind regards, |
| |
| Ward Dossche |

From: "Peter Shintani" <shintani@tv.sony.co.jp>
Subject: seeking advice, which rx mod is the right one for the IC-706

Hi:
Thanks for reading this posting.
I am a little confused as to which is the correct
mod for improving the sensitivity of the VHF RX
on the IC-706.
1) "yellow" wire mod
2) 1) plus re-attaching the "yellow" wire to the appropriate SMD tr
3) removing C153 and C53 on the PA board

I seem to have come across three differnt mod's and I am not too
sure of the various trade offs of the three mods. My understanding
is the 2) is better than 1) but I don't know whether 2) is better than 3)
I tried to look up previous mod data on this subject via Dejanews, but
I could only find comments on 1) and 2) and no comparison with 3)

From: omcdaniel@flosc.net (Olin K. McDaniel)
Subject: WTB - old HamTronics receive converter

I'm looking for an out of production model of HamTronic's receiver converter. It was their model CA50-2, which had an input of 50-54 MHz and an output of 144-148 MHz. I will buy a working unit, with or without the case. However, it MUST include the "Construction and Alignment Instructions", a 3 page document.

Send email with details and asking price to "omcdaniel@flosc.net".

Thanks,

Olin McDaniel, W4PFZ, "Mac"

From: dubner@spk.hp.com (Joe Dubner)
Subject: IC-706 Serial Data Format?

Thanks to K7YJ, N2ZZ, and N6MZV for the replies via E-mail. This
information is from Bob, N6MZV. (I've intentionally omitted his
E-mail address.)

Bob says:

It's ttl level 8n1 data - you can set the baud rate, or let the 706 go
autobaud. If you're only talking from one radio to one computer, you can
use a single MAX232 to do the level shifting to true RS232 levels (you
can get away with a single transistor and a couple resistors and diodes
if you don't want true RS232 levels, but I find the MAX232 route more
reliable).

The Icom box is expensive because the interface is actually a party line
(open collector) design that allows multiple radios to sit on the same
serial bus, and even to control each other. I believe the box also
provides optical isolation which is about the best way to reduce RF
problems.

As to actual data format, the 706 manual sort of describes it- except that the frequency data is in BCD and is sent ass backwards least significant byte first.

The way I figured out what my 706 was doing was to set the serial speed to a known baud rate and hook up a serial monitor. With the 706 Mk II at least, every time you change frequency it spits out update information on the serial port.

[end of Bob's message]

So I still can't understand the high prices (well, I can, really, but I don't like them :-) but I can certainly homebrew myself a TTL-to-RS232 level translator.

From: burch@netline.net (Burch Akin)
Subject: Icom IC-756 vs. Yaesu FT-920

Thought I would throw in my 2 cents on the Icom IC-756 vs. Yaesu FT-920 debate. I recently bought a FT-920 (only had it a little over a week) and so far I love it. I live in an area with alot of powerline noise. The noise blanker on the 920 is great. Takes out almost all of my powerline noise. I can't comment on the IC-756 since I have never used one. There is a good review on the FT-920 at:

http://user.itl.net/~equinox/ft920.html

The author of the article did state that he thought the noise reduction system on the FT-920 was better than the IC-756. Most of

the article talks about the 6 meter operation of the radio.

The TS-430 is a High Frequency amateur radio transceiver. With a suitable antenna, that radio will allow contact with other amateurs world wide. An amateur radio license is required to operate the radio; you earn such a license by passing a test on radio theory, regulations, and procedures, and in most cases morse code.

Hi Mark:

I am not familiar with the TS430S. I did not find any info at the
Kenwood website for that model.
Can you tell me if that radio includes internal ant tuner? VOX ?
CW/SSB filters ?

My brother just bought a boat that includes a Kenwood 430 and I would
like to know more about it. I might be operating WA2RSX /mm from
west coast to east coast via Panama Canal.

Pse Email info to wa2rsx@worldnet.att.net

Subject: VX-1R firmware BAD!!

I will try that and let you know
A10x , anyway, The firmware is ok only on ham bands and Japan's
Public Service Band.

I hope with the AMDS programming that Tone Squelch can be
programmed in for the 470-800 Mhz and
170-222Mhz regions.

It accepts Tone squelch in receive for 380-420
, 420-470, and 800-999.

Also the save function to prolong battery life
does not work in the 470-800 and 170-222 segments.

Should like YAESU DID IT AGAIN as they say in their
advertizements!!! screwed up again , like the mailbox
and DVR and the FT-50R.

No Quality Control, No Critical Design Review
Process in debug problems.

Actually the "HOME" channel can be changed. I have changed mine to
146.52 and 446.00 respectively. You just have to make the "PRI" channel
another memory channel FIRST, as the "PRI" channel cannot be changed.

Yes. That works.

:Funny that that was not in the manual! The only way I could delete
:channels before was to use the ADMS software.

The manual is far from complete. The manual leaves out a step for
clearing the DTMF decode memory. You must press the f key for 1/2
second then the knob for 1/2 second. You can use auto record just
by pressing f followed by the record button.

Mike, are you using Yaesu manufacured pugs and cables? If not, you're
probably shorting the PTT line to ground.

Subject: Hy Gain Hy-Quad antenna...?

Folks,

I bought a Hy Gain Hy-Quad antenna, new in the box, at a Hamfest this weekend. This is the 10m-15m-20m quad, marked with order number 244. Anyone ever use one of these? Although the antenna was new, the manual was missing out of the box. Monday, I'll call Hy Gain, but if anyone has a manual laying around, I'd like to know. If Hy Gain discontinued the antenna a long time ago, they may not have any documentation for it.

Thanks for your help,

73

Well let's see. PL is the tone used to access repeaters. aka CTCSS.

PL is the old name for it. Current ARRL repeater directory p. 33 refers to it as CTCSS(PL). I've forgotten where the term PL came form.

>Keith M. Hamilton, W8GX
>
>khamilton@cisnet.com
>
The receiver offset is about 800 Hz. I " zero beat " by merely
adjusting the s-meter to highest reading on the received signal. Once
set up a 735 and a service monitor. set the service monitor to 14.100
MHz and started generation. Tuned the 735 to " zero beat ", no tone
in the speaker, transmitted and found the 735 to be setting at
14.100. Could not be any easier if you bought it at Sears.

So if you peak the received signal you will be " zero beat " All
ICOM's react this way also.

...snip...
> I particularly like the tunable DSP and the tunable notch filter. I also
> have the narrow CW (500hz) filter, and awaiting the FM module
> (backordered).

Sorry that you had to pay extra money to get FM. I really do not have
a good feeling for how useful (frequently I'd use) FM on HF. Probably
only on 6m and maybe 10m and I think the yaesu idea of FM being extra
is a good one if the price came down in response. It appears, however,
that the rig is still priced high (like the Icom) and only goes higher.
I think the noise reduction DSP processing on the 756 works extremely
well. This is a feature I use ALL the time. The dual pass band tuning
is another which I use all the time. I wonder why anyone would buy
the expensive, traditional plug-in filters.

>
> My biggest reason for the purchase of the 920 over the 756 was that I

> thought the display of the 756 looked too confusing and not as straight
> forward (maybe due to past experience) as the 920.. While I'm sure that

OH, NO! The display, menu system and general layout of the knobs and
buttons is very straight forward on the 756 and easy to use (notice I
did not say learn). If you know anything about modern (post 1970's)
radios, you should be able to figure things out in very short order just
by looking at the front panel - without the manual.

> one can get very proficient operating the 756, I tend to not operate for

>Thanks,
>de Conard WS4S
>ws4s@infoave.net

Look to Communications Specialists in Orange, CA for a tone encoder
module. As for tome on FM, the 251A likely has a voltage supply
labeled like FM8 which is 8 volts only when in FM mode. Hook either
the tone encoder power line or if there is an enabling line to the
source. Now the encoder will be active only when in FM mode.

: W1 and W2. What are they doing?
: Because I don't have any manual, can anyone give me a short description on
: the key combinations?

The cables (wires?) exist in the US "a" version. However, there isn't
a diode at 14 or 15. Also, the keys near PTT are PPT, Light, and Monitor.

I understand the "e" version has a "tone" key in replacement. Also,
thought I don't have my stuff with me right now, I believe that the
transmitting range is a little different.

I'll tell you after I get home and read the book.

From: Steve Ellington <n4lq@iglou.com>
Subject: TS-570 vs Omni V

A Kenwood TS-570 has been the guest of my shack for the past week.
I spent many hours and dozens of QSOs comparing the two rigs and
feel a need to report my findings to the TenTec crowd.

The TS-570 is Kenwood's most modern rig. It's computer interface is
second to none running at 57.6kb through a 9pin serial port directly to
the pc.
Rig control software was available through their Webb page and
performance in that area was awsome. Every button, knob and display was
controlable bi-directional. I was impressed.

Kenwood makes claim to "incredibly clear and powerful audio". However
their manual specifies 1.5 watts at 10% distortion. Hardly what I would
call incredible. SSB and AM sounded quite good but cw was terribly
distorted at low volume levels using an 8 ohm speaker or headphones.

Being a cw operator, I look at a radio somewhat differently than the
average phone operator. I'm interested in the clarity and purity of the
recieved cw tone, proper agc response to qrn, narrow filter performance,
full break-in capabilities and of course a good transmit tone.

Concerning transmitt, the TS-570's tone was reported by all to be
excellent but somewhat softer than the Omni. Under weak signal
conditions, switching to the Omni in mid qso resulted in such comments
as "sounds like you turned on the amp", cpy better now om etc.

QSK on the 570 was fairly smooth and quite but relatively slow. I ran
what I call the "dit busting test". Another stations tries to break
me while I'm sending a string of dits. I sent a string of dits at 25
wpm. I was never able to hear the other station breaking. This test was
duck soup for the old Omni V.

The TS-570 is advertised as a "DSP radio". This is totally incorrect. A
true DSP radio uses dsp technology from the front-end to the audio
amplifier. No coils or transformers are needed in the R.F. chain. Such
receivers are available from Collins for about $16,000. The DSP in the
570 is simply a dsp unit between audio stages and offers less flexiblity
than outboard units such as the MFJ or Timewave.

So here we are on 80 meters at night with S9 static trying to work
another station who is also S9, a tough test for any radio. I had
installed the 500hz filter in the 570. There is only 1 slot for extra
filters. The Omni V has the 500, 250 plus the extra 500hz filter.
Contact was estabilised but copy on the 570 was difficult. I kicked in
the 500hz filter which automatically kicks in a 600hz dsp filter. Noise

level from the qrn increased considerably and copy was impossible. Yes, Kenwoods filters tend to boost qrn! I then pushed the N.R. button. This is supposed to eliminate such noise. This resulted in sound resembling something from a horror movie. Howling, chattering and muttering sounds eminated from the speaker with an occ

That's interesting! About 2 years ago I got rid of an FT530. I loved the HT's features but the thing was back at Yeasu 3 times in 6 months. The replaced the tuning knob among other things. Finally I swapped it for a Kenwood TH79A because the 2 Meter TX would reduce 70 cm receive bay a full 2 s units and Yeasu said that was normal. I don't think its just Yeasu, I believe that transceivers are so complex that something has to go wrong just because of the component count. If you have 30,000 transistors something just has to fail....73

Hi Bruce,
I really like my VX-1R.....I think it's the cat's meow, it's super
cool!......unfortunately right after I bought it I ran into some
unexpected bills and am needing to sell it. If you want it, it's yours. I
paid $317 (including tax) for it on July 3rd at Memphis Amateur
Electronics in Memphis, TN. Make me an offer if you want it.

Please email me at johnsolo(AT)magibox.net (replace (AT) with @)

You can add the YAESU FT-900 series to that list too. The noise blanker is ineffective. Doesn't even take out ignition noise. I was told by YAESU to ship it back to the factory for adjustment, on my nickel of course. Like you, I own several older YAESU radios, but I'll never buy another YAESU product. Who needs these expensive bricks when you can get much more on the Internet 24 hours a day and you don't need to wait on the Sun and its finicky spots. No antennas, no TVI, no incompentent factory techs to hang up on you.

Tnx,

Rube

1440. How does a duplexer work?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-15 00:00:00 UTC
From: "J. Dirk Bremer" <dirkb@myself.com>
Message-ID: <33CBA642.A0D6CC0@myself.com>
Source record: 170253

I have seen pictures of large duplexers as used for repeaters and am curious as to how they work and how they are setup for use with a repeater. Some duplexers look like big cans connected together, what is inside these can-like devices? When using a duplexer with a repeater, do you use a single antenna or multiple antennas? What is the theory behind how a duplexer operates? When using a dual-band mobile, i.e. 2-meter/70cm, are you always required to use a duplexer?

TIA,

Dirk Bremer

The aluminum in that antenna is worth more than $40. You got a great deal. HyGain did discontinue that antenna some time ago. And I know that they no longer have parts for it. It's a great antenna, according t a couple people I know who have or had one. It does have a drawback in that the clips that keep the wire tight to the spacers can break over time.

If you are unable to locate a manual, send some e-mail to Gary NI8Z at "ni8z@cars.org". I know he has a manual, perhaps he will make you a copy and send it to you.

1446. Kenwood TS940 CW filter performance??

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-15 00:00:00 UTC
From: ga19989@evax01.d51.lilly.com
Message-ID: <1997Jul15.092413.1@evax01.d51.lilly.com>
Source record: 170259

Kenwood TS940 CW Filter performance (15 July 1997)

Looking for your actual experiences regarding the TS940.

Bought a used 940 (SN 8MM) in 1993 for 100% CW work. Noticed that the front end was quite "open" so added the 455 KC IF 500 Hz filter. (YG455)

This filter did help front end IMD and overload, but it also boosted signal levels, both audibly and on the S meter! Not only that, but it made the VBT filter a lot of fun to use. With VBT full clockwise (open) I got maybe 600 Hz bandpass, full closed it's about 250 or so. With the NARROW filter out of the circuit performance was as before. In the circuit, there is still significant front end overload, especially with a noise blanker inline. Background noise is only a little improved with filter inline. Position of VBT had no effect on signal levels, consistent high S meter reading (but narrower bandpass) when full closed. As I said, S meter readings improve with filter IN.

Question 1: Has anybody else noticed this phenomenon (the signal boost with just the 455 filter)?

Looking for better CW contest performance, I added the 8.8 MHz IF 500 Hz filter last weekend and cranked up for the IARU contest, running the 455 and 8.8 (the YK-88C-1) together to tighten the front end. I noticed that the VBT was a lot more critical, and with VBT wide open I got no more than 500 Hz bandpass (at least 6-10 dB skirt). I could close the VBT no more than 50% (top center position) before signal strength fell off significantly. At this point, bandpass is about 150 Hz and I don't need my outboard DSP!!! Front end is VERY bulletproof, and strong signals 0.5 Khz away have little effect at this VBT setting. The bad news is that the NARROW filter now reduces overall receiver sensitivity, where before (with just the 455 filter) I got a sensitivity boost. I like to run CW sidetone around 450-500 Hz, which is off the center freq of most IF filters. (for example, TenTec places their IF center frequency at 750 Hz).. so there may be a sensitivity drop if running sidetone offset... in fact, it appears that the 940 prefers a sidetone of 850 hz, as I notice less (or no) degradation of signal strength when using 850 Hz sidetone as opposed to 450 or 550 hz. However, the 550 hz sidetone setting has no signal strength loss if I open the VBT to about 300 Hz bandwidth (3 o'clock position) or more.

Question 2: anybody else running the 8.8 filter notice this?

It looks like a tradeoff... for contests, the extra IF filter is a plus, as sensitivity usually not a big issue for a station running low power class in contests. But on 160 and 80 meter CW in winter, sensitivity will be more critical ... (maybe not, as the sensitivity on the 940 was almost

TOO good, and I got a lot of atmospheric QRN crap that I needed to use the attenuator on last winter on 160...) The problem is that, for "ESP" contacts on 160, a sidetone of 400 hz would work better in the static.

Question 3: Has anybody tried adding separate switching to take individual IF filters in and out, like newer rigs do now (I had an Omni VI+ for a few weeks, and liked that feature... not enough to like the 750 Hz sidetone.)?

If so, how did you do it? Without looking at schematics, I am thinking of wiring the filter jumper (that you cut when you install the filter) back into the circuit via a switch. But wire length and capacitive coupling may be a problem. Nothing to lose by trying, but first let's find out what others have done). May need solid state switch at the filter.

Thanks for your time...

Mel KJ9C

Phil-

The symptoms you describe sound as if the repeater has the real problem. Before you take the radio back, consider this: Some repeaters have their levels set to emphasize voices of people who like to talk far away from their microphones. Ham transmitters are NOT broadcast stations. Proper adjustment requires speaking close to the microphone, not 6 inches away. This is especially true when the transmitter is used in a noisy mobile environment.

If the repeater is mis-adjusted so that stations with low modulation come out as loud as those with full modulation, then the sub-audible CTCSS (PL) tone will be clearly heard, and stations with full modulation will sound distorted. This may be the way your repeater operators have decided to run it, but it isn't a fair test of your rig. You might listen to stations on the input frequency of the repeater, and compare with the voice level being repeated. Idealy, they should sound identical.

If you don't have access to test equipment, ask your friends for comparisons with other rigs on SIMPLEX. If you can hear the other rigs you are being compared with, you can get a better idea of how you sound.

Hi Thanks for reading,
I am looking for mods for my kenwood/trio TR751e,
what i would like to do is to get it to rx below 144.00
i have got the display to read 140 to 150 but it only rx,s from 144 to 150
dont know why?? the display shows a small minus sign when trying
to tune below 144 mhz !!
any help would be of great use ....73s DE dave Gw7pny

1450. NEED Kenwood TM-221A set-up info

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-15 00:00:00 UTC
From: rmkrum@earthling.net
Message-ID: <868990505.15973@dejanews.com>
Source record: 170263

I just inherited a nice Kenwood TM-221A transceiver without ANY manuals. In the interest of getting this goodie on the air quickly, I would appreciate any set-up info available, especially on how to program PL tones on a memory or VFO frequency. a quick note should do it.

Don't really need a copy of the manual, since the giver (my dear brother) just hasn't found them yet, and his memory is blank as to how to do it. Since my local repeater works better with tones.....

Many thanks

> Tom

Tom,

I think that there are at leaste 290 memories...

Bank 1 113 memories

52 memories
20 band limit memories 10 upper, 10 lower
10 BC band memories
31 scan memories

Bank 2 203

142 memories
20 band limit memories
10 BC band memories
31 scan memories

I have not tried all of them, but it seams there is some potential to
have 291 as advertised.

I am confused about one thing... what is the charging time for the
battery? Ads indicate either 1 hour or 80 minutes (latest QST), the user
guide indicates two hours.

Despite the flaws, I think the radio is great, esepcially for its size.

TomMay,
KA3GYI

Message-ID: <01bc9150$6df1b6e0$ee921ecc@lwalden.ebmud>
Source record: 170266

I just took the AT-160 interface cable, cut off one end, and soldered the wires from the included multi-pin connector of the 706 to the cut-off end. Plugged the two together and tested it using my Larsen 5/8 wave 2-meter antenna.

Damned if the 160 didn't tune up to 1.1 or better on all bands I tested it on. It even worked on 80 Mtrs. The only real drawback to the 160 is it doesn't tune 6 Mtrs, and the case is a little bit taller than the 706 and a little bit longer too. You also have to use the tune button to keep the SWR down. The 180 is fully automatic. Lee

These settings are purely subjective and depend upon the age and
frequency response (deafness) of the listener. Do you have some
sort of a standard for audio quality that you are tring to compare
to? Otherwise, I'd just get on the air with a dozen different folks
(and rigs) willing to let you fiddle with the base and treble and
comment on what they like (they have to be able to properly tune a
rig though). You may also have to do this again for each mode (SSB
and/or FM) - not sure the audio paths are the same in both cases.

Have Fun,

KO4LW

Yes, the HRO salesman is wrong. The FT-50 can be set up to do as you say. Don't have the manual right in front of me, but I can get the info to you if need be. I think the feature is called "Dual Watch".

From: ga19989@evax01.d51.lilly.com
Subject: Kenwood TS940 CW filter performance??

Kenwood TS940 CW Filter performance (15 July 1997)

Looking for your actual experiences regarding the TS940.

Bought a used 940 (SN 8MM) in 1993 for 100% CW work. Noticed that the
front end was quite "open" so added the 455 KC IF 500 Hz filter. (YG455)

This filter did help front end IMD and overload, but it also boosted
signal levels, both audibly and on the S meter! Not only that, but it
made the VBT filter a lot of fun to use. With VBT full clockwise (open)
I
got maybe 600 Hz bandpass, full closed it's about 250 or so. With the
NARROW filter out of the circuit performance was as before. In the

circuit, there is still significant front end overload, especially with a
noise blanker inline. Background noise is only a little improved with
filter inline. Position of VBT had no effect on signal levels, consistent
high S meter reading (but narrower bandpass) when full closed. As I said,
S meter readings improve with filter IN.

Question 1: Has anybody else noticed this phenomenon (the signal boost
with just the 455 filter)?

Looking for better CW contest performance, I added the 8.8 MHz IF 500 Hz
filter last weekend and cranked up for the IARU contest, running the 455
and 8.8 (the YK-88C-1) together to tighten the front end. I noticed that
the VBT was a lot more critical, and with VBT wide open I got no more
than 500 Hz bandpass (at least 6-10 dB skirt). I could close the
VBT no more than 50% (top center position) before signal strength fell
off significantly. At this point, bandpass is about 150 Hz and I don't
need my outboard DSP!!! Front end is VERY bulletproof, and strong signals
0.5 Khz away have little effect at this VBT setting. The bad news is that
the NARROW filter now reduces overall receiver sensitivity, where before
(with just the 455 filter) I got a sensitivity boost. I like to run CW
sidetone around 450-500 Hz, which is off the center freq of most IF
filters. (for example, TenTec places their IF center frequency at 750
Hz).. so there may be a sensitivity drop if running sidetone offset... in fact,
it appears that the 940 prefers a sidetone of 850 hz, as I notice less
(or no) degradation of signal strength when using 850 Hz sidetone as opposed to
450 or 550 hz. However, the 550 hz sidetone setting has no signal strength loss
if I open the VBT to about 300 Hz bandwidth (3 o'clock position) or more.

Question 2: anybody else running the 8.8 filter notice this?

It looks like a tradeoff... for contests, the extra IF filter is a plus,
as sensitivity usually not a big issue for a station running low power
class in contests. But on 160 and 80 meter CW in winter, sensitivity will
be more critical ... (maybe not, as the sensitivity on the 940 was almost
TOO good, and I got a lot of atmospheric QRN crap that I needed to use the
attenuator on last winter on 160...) The problem is that, for "ESP" contacts on
160, a sidetone of 400 hz would work better in the static.

Question 3: Has anybody tried adding separate switching to take individual
IF filters in and out, like newer rigs do now (I had an Omni VI+ for a few
weeks, and liked that feature... not enough to like the 750 Hz sidetone.)?

If so, how did you do it? Without looking at schematics, I am thinking of
wiring the filter jumper (that you cut when you install the filter) back into the circuit via a switch. But wire length and capacitive coupling may be a problem. Nothing to lose by trying, but first let's find out what others have done). May need solid state switch at the filter.

Thanks for your time...

Mel KJ9C

From: Shawnerz@xSprintmail.com (Shawn)
Subject: Morse Code in Music: New Oasis Song

This is a little bit off the subject, but here goes. About 2 years ago when the packet network was at it's peak, there was a post in regard to morse code in music. It was batted around the country and people added Kate Bush, Roger Waters (Radio Kaos) and other artists. I thought of the post this passed week as I heard the new Oasis single, "Right here, Right Now" or something close to that. There are some tones at the beginning and the end of the song that are supposed to sound like morse code. It isn't. You can tell it was what somebody thought Morse code *should* sound like. There were some random "S's", "A's", "E's", and "T's" but no words. I thought it

would be neat to send "OASIS" over and over again, but they didn't ask me....
You know, if you're an artist and want to and Morse code in your music, I'm sure there are hundreds of hams that would love to do it!

AAhhhhhh, I can imagine it now...the recording sessions, the concert tours, the groupies!!!
The conversation would probably go like this:

Me: "Hey, you know, I'm in the band."

Groupie:"Oh yeah, what do you play?"

Me: "Well, I'm the Morse code operator?"

Groupie: "Oh, you were that geek on stage!"

On another semi-related thought, I remember seeing this movie one night where these people owned a tavern during World War II. The owner and the piano player were in the resistance movement. The piano was modified and one key was connected to a transmitter. The player would send morse code WHILE playing music while the Germans were drinking in the bar. Pretty wild, eh?

Thanks for reading a post that has little to do with amateur equipment.

-Shawn

From: "Don Gray" <lbol@panther.uwo.ca>
Subject: WTB:Crystals for HF Rig

Hi and thanks for reading this.

I have a crystal controlled HF rig that I'd like to get into operation.
It
will operate on the 80 & 40 M ham bands and frequencies outside them
from
about 2 to 10 MHz. The crystal frequency is the desried carrier
frequency
plus 10.7 Mhz. The crystal size is the miniature plug in type, the same
size as was found in most scanners and HTs etc. before things got
synthesized. By the way, if anyone knows the proper desgination for this
size of crystal please let me know.

I'd like to get an assortment for 80 and 40 (CW and phone) and as well,
I'd
be interested in crystals that would give me receive on some common SW
frequencies (i.e. WWV, CHU, BBC VOA). So I'm basically looking for
crystals
between 14.033 MHZ (CHU at 3.333+10.7) and 20.7 MHZ (WWV at 10.00+10.7).
In
between that range I'm mostly interested in crystals from 14.2 Mhz to
14.7
Mhz (80M) and 17.7 Mhz to 18 Mhz (40M)

If you've got something that fits into the above frequencies and is in
the

size of holder I'm looking for, please send me an email describing the crystal frequency(s) and how much you're asking for it (them).

Thanks,

Don

Tom, ICOM has a 6-page handout available from HRO and others which details how to use the crossband repeat function in all of their radios. Basic steps are put the freqs into the two VFO's. Put the radio into remote mode. Using the DTMF mike or another radio transmitting on the control frequency (the sub band freq) press DB*. To turn off the crossband DB XXX #. The XXX's represent your security code which is dialed into one of the special memories on the radio.

One of their "people" e-mailed me several months ago when I stated that a replacement for the FT990 was in the wings, that it would include 6 meters and many of the 100mp features. He strongly denied this and my claim that the 990 was being phased out. Let's see now-what do we have now ? FT920 ??? Think I'll stick with my Ten Tec gear-at least they're straight-shooters. These settings are purely subjective and depend upon the age and
frequency response (deafness) of the listener. Do you have some
sort of a standard for audio quality that you are tring to compare
to? Otherwise, I'd just get on the air with a dozen different folks
(and rigs) willing to let you fiddle with the base and treble and
comment on what they like (they have to be able to properly tune a
rig though). You may also have to do this again for each mode (SSB
and/or FM) - not sure the audio paths are the same in both cases.

Have Fun,

I don't know about the 920, but the with the 756 if you don't like the
audio you can change it. It is the only rig I've seen that allows you
to alter the RX and TX base and treble!

This Sunday is SweatFest 97 in Brunswick, MD
Date: Sunday July 20th
Hamfest Time - 7AM - 3 PM
Tickets - $5
Tailgate -$5
Indoor - $20

In addition to the tailgate and indoor vendors, we will have the following activities:

ARRL VEC Test Session "veteam@aol.com"
ATV Display
Skywarn/ARES discussion

There are also activities for the whole family. The hamfest is located in historic Brunswick next to the C&O canal. The Brunswick RailRoad Museum will be open as well as the many craft shops in the village of Brunswick. A craft show will also be in operation in town with a shuttle bus available from the railroad museum.

Source record: 170277

Through an estate sale, I picked up a IC-706 and a Diamond MV3A
antenna with an aditional 40m stinger.

I have the 2m connector on the 706 connected to my 2m class mount
antenna so I'm not warried about 2 meters.

Acording to the catalog, the MV3A covers 30m/6m/2m. The swr metter
built into the 706 says 6m is a 3:1 and both 10 and 40m are gratter then

6:1.

How to I tune the antenna to cover the 40, 30, and 6 meter bands?

Email me at markg@okcforum.org

Source record: 170280

Hi all,

I have now added a QRP linear amplifier to the collection. It was designed as the final stage for my Phasing-type SSB exciter, but with over 30dB of gain it will make a lovely CW / SSB transmitter when used with a simple oscillator/driver. I have used it for 10w with my Grid Dip Oscillator (GDO) as a driver. The hand-drawn PCB foil pattern is also included as a GIF file (drawn before I had a PC computer).

I have also added a dead easy 15v PSU. No IC's or any complicated stuff. Can be extended to form a regulated 0-15v PSU with current limiting (only two active devices).

I am adding more circuits to my homepage constantly, as long as I have time available to do it. Have fun with QRP (and QRO). Harry, SM0VPO (G4VVJ), Upplands V�sby, Sweden.

Source record: 170286

Hi:

I am looking for info on a Phelps-Dodge 80 Meter vertical antenna. A friend has come across an commercial grade antenna by this company, (their Catalog # 315) but the top section has been cut and is not all there. Sure would like to find some specs on it cause it is built like a battleship and I am sure it could be repaired and adjusted to the Ham band. I cannot turn up anything related to antennas for this company by searching the web, only place their name appears is relative to international mining and finance.

Any info would be appreciated

Thanks

1478. Yaesu Quality Problems

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-15 00:00:00 UTC
From: cluett@mv.mv.com
Message-ID: <EDC32s.1C4@mv.mv.com>
Source record: 170318

Three weeks ago I wrote the president of Yaesu U.S.A. a letter about their quality standards. To date, no one at Yaesu has answered it. My letter to Yaesu is included in this posting.

In the meantime members of my local club have reminded me that they had problems with the tuning control on their new FT-2400 and FT-2500. These radios would skip frequencies as the knob was tuned across the band. There were serious problems with new FT-530s with a problem described as "motor-boating." Several members described a problem with their handy making an intermittent putt-putt noise.

I am a definitely a Yaesu fan. But they seem to have a policy of selling radios which they know have serious problems. And I must say, this is definitely eroding one user's brand loyalty.

---- LETTER FOLLOWS ----

President, Yaesu U.S.A.
17210 Edwards Road
Cerritos, California 90703

June 24, 1997

Dear Sir/Madam:

Two weeks ago I bought a new FT-8100. This morning I had to send it back to Yaesu.

I own 8 Yaesu radios. I like them all. But I've had to return two of them within the first several weeks of owning them. I hope you'll take a minute to read this.

I want you to know that there is no single thing that Yaesu could do to demoralize or discourage its customers more than to ship a defective radio. There is nothing so upsetting to a customer as to pay $600 for a radio, and then put it back in the box and be forced to pay to ship it to Yaesu for upto a month to have it repaired.

My FT-8100 did not cross-band properly. When I called tech support about this problem, I was told it was a well documented fault and it would have to be returned at my expense for modification.

Dealers should have been notified about this problem as soon as it was discovered, and it should have been removed from dealer shelves. To knowingly sell a defective radio and then require your customers to pay to have it shipped back to Yaesu is unconscionable. Please change your policy. Do not ask your customers to pay a single penny for your mistakes.

Hams in my area wrestled with documented audio problems in the 8500 for months. Some of them returned their radios several times.

I appreciate the innovation that Yaesu has brought to ham radio. I appreciate that you must develop and deliver new designs quickly. Please be certain that your customers value quality more than either of these. Please, spend more time on quality control before shipping. And please, never knowingly ship a product which has documented, serious faults.

I am forwarding this letter to the editor of our club newsletter. I will be happy to forward your reply as well.

Thank you for your patient reading.

It might be easier to connect your radio to a sound card in your
computer and use the standard sound recording software to record your
QSOs on your hard disk. Most digital voice recorders don't hold very
much time, maybe 60 seconds at the most.

You can simply plug the sound card into the earphone jack in the
radio. (I'm assuming the FT470 is a hand-held rig? I work almost
exclusively HF.) You'll need to make sure the "sound mixer"
application for your sound card has "Line In" turned on; then, you can
hear the receiver audio through your computer speaker.

You guessed right. The radio itself does not cross-band repeat. It
offers cross-band splits which are useful if you are doing a
cross-band repeat (one-way).

regards, Don (KE4KYO)

The Standard C510A will cross band by listening to one band and then
transmitted in another band.
ie: receive on VHF, tx on UHF ... or... receive on UHF, tx on VHF. It does
not RX & TX at the same time.
It works very well, using my vehicle radio as the cross band repeater, my
C510A can talk to it, extending its range and power.

John,

The ft-50rd will tx on one band and rx on another. Mine is set up that way
right now.
If you have the software for computer its easy to do. Just click on the
box called split and type in the freqs you want and download back to radio.

Source record: 170094

I'm trying to connect an Addonis AM-6000G to a Kenwood TS-700S. I have no schematic for the mike pinout. I've tried checking the mike pins with an ohm meter and continuity tester, and the closest match I can come up with for the keying circuit shows 10K ohms when the PTT button is pressed. This is pin 4 on the 8 pin connector. The only pin that shows continuity to ground is the mike shield, pin 1. Pins 1 and 2 are easily identified by removing the mike case, and the only shielded wire goes to those pins, ergo they have to be the mike connection. I don't have the original Addonis cable that I once used with my Icom 735 to go by. Shouldn't there be a pin besides the mike shield that goes to ground, and is a 10K ohm connection to the PTT pin on the Kenwood TS-700 enough to place the radio into transmit? I could experiment and connect a 10K resistor from PTT to ground and see what happens, but I'd rather just be correct from the get-go. Thanks for any information, 73, Web Williams, KR4WM in Myrtle Beach, SC

1505. FORSALE - Kenwood TS-520S + VFO-520S Mint, great starter rig

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-16 00:00:00 UTC
From: jpl@qc10.ho.lucent.com
Message-ID: <5qiq5c$bfi@nntpa.cb.lucent.com>
Source record: 170095
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment,nj.forsale

I have a mint Kenwood TS-520S plus the optional matching remote
VFO-520S that I would like to sell. In my opinion, the 520
and 520S are some of the best rigs around and would make a
fantastic beginner station or a great backup rig.
The remote VFO is a wonderful option to have and give
the capability to either run split frequencies or to flip-flop
between two frequencies.

For any novices not familiar with this radio, it is all solid state
(discrete components, so its very easy to repair if ever needed)
except for a tube driver and a pair of very
robust 6146 tubes as the finals. It has a builit in power supply,
but can also run off of 12VDC with the optional DS-1A
DC-DC convertor. It also has connections for the
Kenwood DG-5 digital display.
It covers 160,80,40,20,15, and 10 meters in CW and SSB (upper and lower) modes.
The receiver section is excellent and I always get excellent audio quality
reports. Many folks say that these older Kenwoods are some of the best
sounding rigs on the air.

This rig also has the optional 500Hz CW filter
installed (genuine Kenwood option).

The price is $400 firm + shipping. You might find one for a few $ less,
but NOT is this great condition.

I have a virtually immaculate Kenwoods TS-520 rig that I would like to sell.
This was my first "real radio and in my opintion is still
one of the best rigs around. It would make a fantastic beginner
station or a great backup rig.

I am only the second owner of the rig.
I purchased it from a collegue of mine at Bell Labs (who
was the original owner), and I have the orignal sales receipt,
boxes, and manual for it. Both he and I took
exceptionally good care of this rig. It has NEVER been in a smoking
environment and has NEVER been mobiled.

For any novices not familiar with this radio, it is all solid state
(discrete components, so its very easy to repair if ever needed)
except for a tube driver and a pair of very
robust 6146 tubes as the finals. It has a builit in power supply,
but can also run off of 12VDC.
It covers 80,40,20,15, and 10 meters in CW and SSB (upper and lower) modes.
The receiver section is excellent and I always get excellent audio quality
reports. Many folks say that these older Kenwoods are some of the best
sounding rigs on the air.

This rig also has the optional 500Hz CW filter
installed (genuine Kenwood option).

The price is $300 firm + shipping. You might find one for a few $ less,
but NOT is this great condition.

Hi ..
I own one and it works MOST of the time. The radio receives its signal
from WWVB (long wave) and "listens" at 0100 (EST) each evening to
update the clock. Unfortunately, the clock must be in a good location.
Those on the East Coast will have the most problems. However, I
understand that WWVB will be increasing power this Fall...so this should
improve reception. AS for out-of-USA reception, I'm not sure.
The other problem (for Hams) is that the current production does not
have a 24hr format setting. I believe they will have a "GMT" clock
offered this Fall. They have a WEB site and you can check this out.

Good Luck..and Good Times..

That is in the manual, but it's MASKING a memory, not deleting it. You can recall that memory you just masked by pressing function for 1/2 sec (just like you are going to write a new memory), turn to the memory you have masked and hit MR again. Voila, you now have restored the data you previously thought you erased.

Does anyone know how to REALLY delete a memory?

I've enjoyed my HTX-202, but it doesn't have expanded receive
(beyond the 2-meter band) and has only 16 memory channels.
It's a terrific radio with solid on-the-air performance. If your
budget dictates a single-band handheld, you might look at this
radio plus some of the others that offer expanded receive, more
memory channels, etc. for $150-200. If you can do so, I suggest
that you look for a good dual-band radio such as a Yaesu.

I just ordered an Alinco DJ-S11T, a small 2-meter handheld, for
$120. I haven't received it yet, but I think you'd want much more
for your first handheld.

I can't recommend a base unit; I have no experience with them.

> Will I need an external antenna? I am apparently in a shadow, with no
repeater in sight, however a local group is working with a radio station to
place a repeater at their mountain-top location, which will illuminate our
whole valley and several more to the east and west.

I'd recommend a good outside antenna. Perhaps someone else can offer
specific advice here.

I have 2 Kenwood TK-340 hand held radios. Looking for information on them. They currently on a repeater but I don't know who's. I just bought these at a pawn shop and have 2 weeks to decide if to keep them.

Info I am looking for:

What freq range are these: My guess is 440-470

Watts:

What is this booster-pac (cig lighter on one side - AC DC converter on the other)

What type of accessories are available and where.

THANKS VERY MUCH

Hi Dick,

How many guys are making screw-driver antennas? I went to your site and it claims a patent. Also Don Johnson W6AAQ claims a patent on it at his site W6AAQ@mother

I keep hearing about this screwdriver for 3-30 Mhz mobile and from the photos at your site it looks to me like a long coil mounted at the base and a whip comming out of the top. An electric screw driver turns a long screw that adjusts the slider inside the coil to adjust it.

I scrounged a similar coil made a long time ago by Master Mobile (I think). It's not as fancy or automatic as the screw driver, but it should work. The problem is I can adjust it to resonate at the correct freq. but the impedance is VERY low. I have an AUTECK RF-1 (A digital sorta MFJ-259) and I get a reading of around 10 ohms.

Both your site and Dons describe a matching network at the base. Is this network a toroid transformer or something? Hows it work? Could I use T-200-2 powdered iron toriod. How would I wind it?

You are CORRECT, kind sir. The info was given to the entire newsgroup about a week ago by someone I met at the Dayton Hamvention, a Yaesu Representative. I really did not understand the foolishness of memory masking, so I didn't bother reading about it when going through the manual. If this doesn't work, perhaps the only way to get to CHu (for unused channel) is to do it via the ADMS software. I have been searching for a way to delete memories since I had the beast!

According to the manual it can and the way to do it *is* documented. I
believe the FT-50 only has one VFO, but since you are not running
full-dup (like a repeater would be) you only need one.

Here's what I did and what I sent to Keith:

I received the amplifier yesterday evening. The unit was well packed and
arrived as promised in your recent Usenet posting.

As a precaution, before connecting this thing to power, I thought it
might be a good idea to test the transistors first. The transistors
installed on the PCB were ECG352s. According to my references,
these transistors are NPN silicon RF power transistors rated at 80W
output with a Vcc of 12V and input power of 12 watts. Using a type 316-01
case, the wide flanges on either side of the transistor are the emitter,
the narrow strip on one side in the middle is the collector, and the wide
strip on the opposite side in the middle is the base. After carefully
disconnecting the resistor and input transformer lead from the transistor
base pad on the PCB, I used a multimeter (on transistor-diode check
position) to check the base-emitter junction. Semiconductor theory would
lead me to expect a reading of 0.5 to 0.8 volts across the junction with
the positive lead of the meter on the base and the negative lead on the
emitter. Unfortunately, this was not the case, indicating positively that
the transistors are defective.

Yes, it can, but not at the same time ("cross-band repeat"), which the FT-51 can do. It will run semi-duplex, transmitting on 2 meters, and receiving on 450 mHz and the other way around. The FT-50 does have two VFO's.

| 'z2.fidonet.org'-domain, was detected at this site and classified as |
| unwanted. |
| |
| If you bona-fide responded to a listserver your message unfortunately |
| also falls under that category as such type of mail is not accepted |
| nor distributed from here either. |
| |
| 'fidonet.org' is a hobby domain where individual |
| people run individual mailers using PSTN-technology out of their own |
| pocket and every such message adds to the cost. |
| |
| Therfore the original message is bounced back to you at the gate. |
| |
| Fidonet-participants are victimised by thousands of bogus listserver- |
| subscriptions and you may very well be a side-victim of this. |
| |
| In that case your cooperation would be greatly valued by crossposting |
| this mail to the postmaster/owner of the mailing-list/list-server with |
| a request to kick any subscription coming the 'z2.fidonet.org'-domain. |
| We are bothered here by it as much as you are now. |
| |
| If you are residing in the USA then the following notice |
| may apply to you. Please read it attentively! |
| |
| +-------------------------------------------------------------+ |
| | By US Code Title 47, Sec. 227(a)(2)(B), a computer/modem | |
| | /printer meets the definition of a telephone fax/machine. | |
| | By Sec. 227(b)(1)(C), it is unlawful to send any unsolicited | |
| | materials to such equipment. | |
| | | |
| | By Sec.227(b)(3)(C), a violation of the aforementioned | |
| | section is punishable by action to recover actual monetary | |
| | loss, or $500, whichever is greater, for each violation. | |
| | | |
| | I will report any violation 'abuse@postoffice.us'. | |
| +-------------------------------------------------------------+ |

Subject: Ancient Equipment

I was an amateur back in the 60s while growing up. Had to give it up. I
still have most of my rig packed away. This includes a Viking II CW-AM
transmitter, a Hallicrafters SX-110 receiver (which still works) and
some other support gear such as an Astatic JT-30 mike, Johnson antenna
match box, a "bug" and other things. Is any of this stuff still
usable ?

Should I have it bronzed or throw it out?

Subject: Can FT-50RD RX on one band and TX on the other?

zucchini@ix.netcom.com (John Keeney) wrote:

:Can the Yaesu FT-50RD receive on one band and transmit on the other? A
:salesman at the HRO in Virginia insists that it will not and that I
:would need a radio with 2 VFOs (like the FT-51) to do that. A couple
:of FT-50 owners disagree with the HRO salesman.

The FT-50 can be set to TX on any frequency in the two bands and RX
on any frequency in the extended receive range. So, if you desire, you
can set TX to 146.5 and RX to 499.8 for example.

:I want to be able to use a HT to transmit to a mobile (setup as a
:crossband repeater) which in turn transmits to the input frequency of
:a fixed repeater and receive the output frequency on the HT.

I plan to do that very thing with my FT-50 and an FT-3000.

Barry

Hey,
there is a new one that just sprang up. See below:

Rube
SUBJECT: *NEW* Fox_Tango Reflector
DATE: 15 Jun 1997 18:29:00 -0700
ORGANIZATION: "Short Circuits" (of Az)

NEW Fox_Tango Reflector

Fox_Tango is a mailing list (reflector) devoted entirely
to "vintage" and "classic" equipment manufactured by the
Yaesu Musen Co., Ltd. of Tokyo Japan.

* equipment, accessories
* collecting, restoring, refurbishing
* buy, sell, trade, swap
* repairs, modifications, enhancements
* questions, discussions, etc
* just plain operating old Yaesu stuff

To be added to the mailing list, send email as follows:
TO: majordomo@qsl.net
SUBJECT:
BODY: subscribe fox_tango

To be deleted from the mailing list, send email as follows:
TO: majordomo@qsl.net
SUBJECT:
BODY: unsubscribe fox_tango

To post items to the reflector, send email as follows:
TO: fox_tango@qsl.net

If you have questions or need assistance contact: k7on@qsl.net

Subject: Can FT-50RD RX on one band and TX on the other?

zucchini@ix.netcom.com (John Keeney) wrote:

:Can the Yaesu FT-50RD receive on one band and transmit on the other? A
:salesman at the HRO in Virginia insists that it will not and that I
:would need a radio with 2 VFOs (like the FT-51) to do that. A couple
:of FT-50 owners disagree with the HRO salesman.

The FT-50 can be set to TX on any frequency in the two bands and RX
on any frequency in the extended receive range. So, if you desire, you
can set TX to 146.5 and RX to 499.8 for example.

:I want to be able to use a HT to transmit to a mobile (setup as a
:crossband repeater) which in turn transmits to the input frequency of
:a fixed repeater and receive the output frequency on the HT.

I plan to do that very thing with my FT-50 and an FT-3000.

Barry

cookt@ouvaxa.cats.ohiou.edu wrote:
: I'm looking for a 12 Foot mast that's not too heavy, maybe
: aluminum thick 1/8" wall pipe. I would appreciate any ideas
: you might have. I was thinking of using PVC Pipe, maybe filling
: with foam.. Thanks for your input... Tim WB8BCO tcook1@ohiou.edu

Skip the PVC pipe -- UV radiation will turn it to dust in a couple'o
years.
Go to your local hardware dealer(s) and price top rail pipe use in chain
link fencing -- I think it can be had in 10', 15', and 20' lengths.
Pick the one you find with the best wall thickness...
I'm using one for my tri-bander/6mtr/2mtr installation.
And we use four (properly) cut 20 footers to put up a phased 2-element
40mtr verticle on Field Day. One end of the pipe is already necked down
for about 6" to enable it to slip into the next section.

Subject: ICOM 735 Remote Serial Port - HELP!

See February, 1993 QST page 37 for a good explanation.
Note that the Figure 2 Icom/Tentec inset is all that is req;uired
if
the required
RS-232 conversion to 5 volts is done. The Figure 2 circuit should work
well.
Alternatively, I have done it with 5 transistors. Some have had good
luck with just
2 or 3 transistors but may under drive the RS-232 bus.

Good Luck
John KH7T

Subject: Icom IC756 any comments on this radio??

> Hi there
>
> I am thinking of buying an IC756 as a complete answer to HF & 6M
> ....should I ???? I hope to gain my Novice licence soon and would like to
> only buy a HF rig once! Any suggestions would be appreciated (pro's &
> con's etc.)
>
> thanks
> allan@ruralnet.net.au
>

well allan i spent 4 hours playing with the 756,920, and the 870s I found the dsp on recieve on the 756 lacked quite a bit and the display goes amiss when tuning the freq. you tend to overturn on the vfo and re-overturn going back because the display is not sharp and ez to read like the normal led vfo numbers,
the quality on the dual recieve i didn't like and the general spec analyzer i didn't think was good at all [mind it's not a 781] . I found the 920 the dsp was ok but lacked a li'l as far as cw eliminating the hash on cw mind you would

have been btter if the 500k cw filter was install[aftermarket b.t.w.] as well as the fm board.... and a.m. as well i believe. in general attractive and user friendly however the dsp is not in the if it is in the audio section for tx/rx
.

the 870 i found was the bast of the bunch for dsp and especially on cw as well as ssb the menu is user friendly once you get a handle on it and is pc user ready and programable from the home pc as well. I found the quality of the 870 surpassed the 6m extra from the 920 and 756 and price wise when you take in the

extra filters for the 756 and the board and filters for the 920 it more than equeled the extra features of the 870 re: no filters to buy for the 870 .

just my personal findings i hope that this has helped you for things to look for when buying the rig of your choice ..

: aluminum thick 1/8" wall pipe. I would appreciate any ideas
: you might have. I was thinking of using PVC Pipe, maybe filling
: with foam.. Thanks for your input... Tim WB8BCO tcook1@ohiou.edu

Skip the PVC pipe -- UV radiation will turn it to dust in a couple'o
years.
Go to your local hardware dealer(s) and price top rail pipe use in chain
link fencing -- I think it can be had in 10', 15', and 20' lengths.
Pick the one you find with the best wall thickness...
I'm using one for my tri-bander/6mtr/2mtr installation.
And we use four (properly) cut 20 footers to put up a phased 2-element
40mtr verticle on Field Day. One end of the pipe is already necked down
for about 6" to enable it to slip into the next section.

Subject: ICOM 735 Remote Serial Port - HELP!

See February, 1993 QST page 37 for a good explanation.
Note that the Figure 2 Icom/Tentec inset is all that is req;uired
if
the required
RS-232 conversion to 5 volts is done. The Figure 2 circuit should work
well.
Alternatively, I have done it with 5 transistors. Some have had good
luck with just
2 or 3 transistors but may under drive the RS-232 bus.

Good Luck

Subject: Icom IC756 any comments on this radio??

> Hi there
>
> I am thinking of buying an IC756 as a complete answer to HF & 6M
> ....should I ???? I hope to gain my Novice licence soon and would like to
> only buy a HF rig once! Any suggestions would be appreciated (pro's &
> con's etc.)
>
> thanks
> allan@ruralnet.net.au
>

well allan i spent 4 hours playing with the 756,920, and the 870s I found the dsp on recieve on the 756 lacked quite a bit and the display goes amiss when tuning the freq. you tend to overturn on the vfo and re-overturn going back because the display is not sharp and ez to read like the normal led vfo numbers,
the quality on the dual recieve i didn't like and the general spec analyzer i didn't think was good at all [mind it's not a 781] . I found the 920 the dsp was ok but lacked a li'l as far as cw eliminating the hash on cw mind you would

have been btter if the 500k cw filter was install[aftermarket b.t.w.] as well as the fm board.... and a.m. as well i believe. in general attractive and user friendly however the dsp is not in the if it is in the audio section for tx/rx
.

the 870 i found was the bast of the bunch for dsp and especially on cw as well as ssb the menu is user friendly once you get a handle on it and is pc user ready and programable from the home pc as well. I found the quality of the 870 surpassed the 6m extra from the 920 and 756 and price wise when you take in the

extra filters for the 756 and the board and filters for the 920 it more than equeled the extra features of the 870 re: no filters to buy for the 870 .

just my personal findings i hope that this has helped you for things to look for when buying the rig of your choice ..

>inside these can-like devices?
The more popular duplexer is the pass/reject type, that is the "big
can" passes the desired frequency (transmit) and a notch filter
rejects the other (receive) frequency. Another set of cavities does
just the opposite, that is, passes the receive frequency and rejects
the transmit frequency.

The "big cans" are called cavities and are designed so that they can
be tuned to the frequency of interest and offer a narrow pass band.

> When using a duplexer with a repeater,
>do you use a single antenna or multiple antennas?
You can do either.

> What is the theory
>behind how a duplexer operates?
See the ARRL Antenna Handbook.

> When using a dual-band mobile, i.e.
>2-meter/70cm, are you always required to use a duplexer?

Don't confuse a duplexer with a diplexer. A diplexer is used to share
an antenna with two different radio bands or two antennas with one
radio. I have see diplexers called a duplexer by the manufacture which
causes confussion.

Legal Warning: Anyone sending me unsolicited/commercial email WILL be charged
a $100 proof-reading fee. Do NOT send junk email to me - consider this an
official notice:

"By US Code Title 47, Sec.227(a)(2)(B), a computer/modem/printer meets the
definition of a telephone fax machine. By Sec.227(b)(1)(C), it is unlawful
to send any unsolicited advertisement to such equipment. By Sec.227(b)(3)(C),
a violation of the aforementioned Section is punishable by action to recover
actual monetary loss, or $500, whichever is greater, for each violation."

Their antenna division used to be named Communication Products Company
but I don't know if they are still in business...I have an old address
from 1967 ARRL handbook that shows them in Marlboro, NJ...201 462 1880..
I did a search on that number and came up with a new area code and name.
908-462-1880 is listed as Celwave RF, Inc. in Marlboro, NJ...I know
Celwave RF makes antennas and may be the people who bought out
Phelps-Dodge Communication Products Co....Good Luck, 73

1552. What's a Yaesu FT-2700

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-16 00:00:00 UTC
From: Joe FITR BV/N0IAT <joentam@transend.com.tw>
Message-ID: <33CC574B.506A@transend.com.tw>
Source record: 170158

Hi,
Can anyone give me some details about a Yaesu FT-2700
transceiver?

I'm not able to recall what it was. I *THINK* it's a dual
band, 25W 144/440 mobile transceiver made about 1986 or 1987.

Can anyone provide more info? How many memories, duplexer
included, power output, modifications for extended receive,
cross band repeat, problems, etc? Anyone using one and have
comments good or bad?

Thanks,
Joe

1553. FS : Kenwood TM-733A w/ Original Manual & Packaging

1555. Yaesu VX-1R first thoughts

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-16 00:00:00 UTC
From: cwop@aol.com
Message-ID: <19970716073701.DAA09777@ladder02.news.aol.com>
Source record: 170161

I've had my new HT for about 6 hours now. Some thoughts:

The broadcast band receiver is a joke. The manual suggests that you remove the duck and attach an external antenna. I thought maybe I could listen to talk shows when out walking, the HT in reserve. Nope. Good idea - bad design. When I did attach an outside antenna it sounded like my first crystal set, many stations at one time.

The only other HT I have is my 2 meter Icom IC2SAT. (It was considered small in its day also) The rigs compare favorably on receive while in the ham band and the VX1 had a more pleasing crisp sound. On the local police 155Mhz frequencies the Icom received twice the signal that the VX1 did. But on the weather 162Mhz frequency the Icom was still full scale but the VX1 barely broke the squelch and was unreadable. Obviously the rig is optimized for the ham band and parts of the extended receive are unusable with the duck antenna.

The memories are very difficult to load, and you have to juggle the numbers between the bands. If you use 1 through 10 on VHF ham then you can't reuse those numbers on UHF ham. The manual for me was very hard to understand in the memory and scanning areas. I was never able to get the tone scan function to work. Since I never expect to need it that was no big deal but it bugs me when a rig is smarter than me which seems to be the case a lot lately.

I charged the battery for 2 hours and so far after 6 hours of continuous messing around it shows no sign of failing. My old Icom would only go 1 to 2 hours on the internal battery so this will be nice. You can use a AA alkaline battery but need a optional battery holder (That has a voltage doubler built in for 3V out) but the manual reports only 3 hours on this battery. If you could just shove the AA battery in in an emergency that would have been nice but since you have to have the adapter handy its not so handy.

This is one radio that unless you use it a lot, your going to need the manual nearby. Many of the functions are not very intuitive, but with only 10 buttons and a knob I guess that couldn't be avoided.

It cost $299 at my local HRO here in Phoenix. It's the size of a large pager and very light and carries nicely in a pocket. It'll do what I want so I'm not completely unhappy but it certainly doesn't live up to the ads.

Hello Dean,

I've hat the same problem finding info on a older Yaesu rig. But there is a solution to the problem if you contact yaesu via there internet site they will send you the info directly, no costs even.

Hope this helps you, it helped me a lot and i whas very happy with the propt and good service from them.

Greetings,

From: MichaelM <michael@pixi.com>
Message-ID: <33CCA48A.4D1D@pixi.com>
Source record: 170165

Hi,

I have an FT-50R and I was trying to brodcast something off of my computer. I have the speaker microphone adapter and I made a cable to connect my computers audio output to the adapters mic input. Well I wen't to get another radio so I could listen to the brodcast but when I came back it wasn't transmitting. Now I can't get the radio to key up or transmit anything. The PTT button seems to be completely disabled and I don't know what could be the problem. I am fearing the worst that I could have seriously damaged the radio. Any suggestions would be greatly apreciated.

Thank You,

MichaelM

Well, actually, I received an amplifier with two blown transistors. I
checked them as soon as it was received with a multimeter and without
applying power. In one of his posts, Keith, made the statement that I
would probably blow up the amp because I didn't know what I was doing.
Wrong!

I have emailed him with a request for replacement transistors. Haven't
heard anything yet!

It's like we've got a double standard right now regarding what constitutes readily modifiable depending upon the radio being a scanner or an amateur 2 way. The FCC made a big deal about the AOR 8000, and the Trunk Tracker was examined quite carefully. But the VX-1 restores with nothing more than some simple hand tools, no fancy software required. And it's the CAP/MARS mod at that! Of course it could be a fancy marketing ploy to flood the market with the thing, leak the mod into circulation to increase the appeal, and hope they sell like wild before the government says wait a minute. :-) I can see the marketing mission statement now: Who cares about how it works, as long as it has features galore and (easily) unblocked 800 MHz, we will built it and they will buy.

Scott, do yourself and the NJ hams a favor and find something else to keep
you occupied. We don't need any more LandLine Lids, particularly not
SPAM-happy LandLine Lids.

Go somewhere else, try something different. It'll be best for everybody.

Um... I'm just curious... you tested these transistors in circuit
with a multimeter and found they were blown.... could you describe
that test in a little more detail?

What type of transistors does it use? SD1460?

Of course I take it you did apply power afterwards and the thing
didn't work....

>
> Thanks, John

If you use the ADMS software, you can set up a cross-band
configuration. I programmed mine for a receive freq of 146.940 and a
transmit freq of 446.500. It worked fine and the transmitted signal was
verified with a scanner.

I have never attemped to program my FT-50 manually, so I don't know how
that would go. My advice--just buy the ADMS!

> stay on for about 10 seconds after the last key/button is pressed.

Yes Richard,

Press "F" and then the "LAMP" button. The light will stay on
continuously. It will also about double the power consumption if you're
listening on dual band (which is why Kenwood made the normal lamp
function momentary), so try not to do it on battery power any longer
than necessary. I've drained the battery down pretty good doing that.
But if you're on a DC cord, the backlit display is nice, especially
while driving in the dark and trying to figure out whether you just
bumped off the channel or everybody signed off ... Incidentally, this
gets written into the EEPROM, so you have to do F,LAMP again to turn it
off or it will remain on every time you turn on.

From: David Bean <"freewholly "@sisna.com>
Message-ID: <33CD1D00.EA0A3F3F@sisna.com>
Source record: 170182

I'd be very pleased to know what equipment you all might recommend to someone who would like to get involved in ham radio, specifically in the 2-meter range. I'm what you might call a novice novice. My parents are both licensed: Dad has been since I can remember and Mom has been for about three years, but I never paid much attention. I know they will be delighted to tell me whatever I want to know, but I'd like to temper their advice with a broader spectrum (you folks).

Pardon me if my terminology isn't up to snuff, as I really am just in the beginning stages (just research, right now), so I don't yet know the questions to ask.

I'd like to have recommendations for both a handheld and home-based tranceiver. I have a moderate budget, so will have to begin small and 'improve' from there. I would rather wait a little while and afford good quality than buy something I'll regret forever, if you know what I mean.

Will I need an external antenna? -- it won't be a problem, as I'm in a very rural area without restrictions on that kind of thing. My father has an array of antennae, all home-made, at his home which seem to work well for all he does. I am apparently in a shadow, with no repeater in sight, however a local group is working with a radio station to place a repeater at their mountain-top location, which will illuminate our whole valley and several more to the east and west.

Tha about does it for round 1. Thanks in advance for your help.

Dave

"Darrel Toepfer" <toepfer@usa.net> wrote:

>Yeah but what about the turntables???

UPS is prcessing the claim on the turntables even now. They seem to think that goods damaged in transit, by the shipping company, are the responsibility of the shipping company.
I also have a long list of VERY SATISFIED customers who have nothing but nice things to say. In fact, I have noticed that, usually, those who complain publicly do so simply because they can. It seems to give them a thrill as in, for instance, Mr. Nelson and the turntables. Common decency would suggest that he should AT LEAST contact the seller (myself) and notify me of the condition in which the turntables arrived before such wild and thoughtless postings. In fact, I would suggest that each person who reads this think about THEIR actions upon receiving an order that is (as Mr. Nelson stated) "VERY OBVIOUSLY BEATEN UP". Especially after being advised BY THE SELER to REFUSE TO ACCEPT DELIVERY. Would YOU still accept delivery (COD) and then NOT contact the seller and immediately start spreading gossip of this nature? If so, then, I want NOTHING to do with you, now or ever! Mr. Nelson paid exactly 26% of the present cost for a set of these turntables. I have not seen the damage, but, I would assume that they are still repairable (asside from the fact that I had already offered him a choice of full reimbursement or full replacement). What is the guy after? Something for nothing? It would seem to be so. The same goes for Mr. Swearengen, who was told MANY TIMES that his amplifier was on it's way, but insisted anyway that there was some "scam" involved. If he has the ability to inventory the parts on the PC board and the heatsink assembly, he will find that he bought the amplifier, basically, AT COST! Again, are you looking to get something for nothing? My dear friends, were I in this as a business, I would be interested in a PROFIT!
Picture this scenario in your mind, as well. UPS tells me that they are about to cut a check which will reimburse Mr. Nelson his purchase price for the turntables. Where is his gripe? Could it be because he KNOWS that he cannot find another set of these turntables at 26% of cost? He actually paid about $10 more than HALF PRICE for ONE TURNTABLE! Now, how would it work out if I reimbursed him, UPS reimbursed him next week, AND he decided that he would repair the turntables as well? He's already told me that he would rather do that than to send them back. Sounds to me like you CAN get your property and still DOUBLE your money! No thanks, I'll do just what 7 different UPS representatives, in 7 seperate conversations, have already told me to do. It was their screw-up (according to UPS), so I'll let them

handle it. But, I am so glad that so many people are interested in this little "drama" as it could actually prove to be a valuable lesson for all who could either end up on the buying or selling end of one of these deals. BE CAREFUL! Especially when dealing with strangers who have about as much concern for you and your reputation as they have morals!

First, let me suggest that you re-post your inquiry to these two e-mail reflectors. They have a lot of experienced 6m ops.

vhf@w6yx.stanford.edu

and

six-list@I1.net

I use a TS-60 and used to have an Icom IC-551D. I've never used a transverter, but the Ten-Tec 20-to-6 transverter (at under $100) is oftern referred to as a very good bargain. The others (like Down East Microwave) are better, but cost at least three times as much. So, you get what you pay for-- what a shock, eh? I've worked lots of people with both the Ten-Tec transverter and the new little MFJ rig, often at hundreds of miles away while they were using less-than-optimum antennas (like low dipoles). I guess if I were in your shoes (e.g., already had a HF rig), I'd go the Ten-Tec transverter route. It would be a very inexpensive way to try Six-- and would almost certainly be easy to sell if Six turned out to be not your cup of tea. (I say that based on how quickly I've seen them sell on the Usenet and on the VHF e-mail reflectors.) If you really got into 50 MHz, you could upgrade to a more expensive transverter, or to a combination HF/6m rig, or to a 6m-only rig later.

From: cluett@mv.mv.com
Message-ID: <EDHLrv.DqA@mv.mv.com>
Source record: 169994

I recently posted a message entitled "Yaesu Quality Problems" to this newsgroup. In my posting I wrote a letter to the president of Yaesu expressing my concern that Yaesu often ships radios with known problems and then makes customers pay the cost of shipping the radio back to Yaesu for repair. Readers who want to see my original letter can find it using Deja News or a similar search tool.

Today I received a very cordial letter from Mikio Maruya, the Executive Vice President of Yaesu. I have to conclude that Yaesu does listen!

Here is his letter:

Dear Mr. Cluett:

On June 24, 1997 you sent a letter to the President of our company Mr. Hasegawa, concerning your FT-8100. Upon receiving your letter, we forwarded it to our president who works out of our headquarters office in Tokyo, Japan. Shortly thereafter I received a phone call from Mr. Hasegawa expressing his concern regarding the problems you have experienced with your FT-8100.

I am very sorry to hear of the problems you have experienced and the resulting inconvenience it has caused you, as to Yaesu, the customers' contentment is of the utmost importance. Through hard work and perseverance we strive to provide Yaesu customers with stellar service to guarantee that a Yaesu user is always satisfied. Our radios undergo Q.C. both in Tokyo as well as here in the U.S. Regrettably as in your case, problems occasionally still surface.

Please also accept our sincere apologies. Enclosed you will find a check for the shipping charges you spent to send your radio to us via UPS/Brown, which we have estimated to be $6.19, (4 lbs delivered from your address to our office, with $700 for insurance.) Since we are not sure exactly how much you spent, please advise if this amount is incorrect. Mr. Hasegawa will also respond to you, but again since he is in Tokyo it may take a little longer.

If in the future we can be of further assistance,
please don't hesitate to contact us. Also I understand
you own a lot of Yaesu equipment; thank you for your
support in choosing our products. Your kind cooperation
and understanding are appreciated.

Best Regards,

Mikio Maruya
Executive Vice President

I'm using version 1.2 and the only time I had a problem, the guys at RT
said it was a speed compatibility problem between the com port and the
radio.
The data was being transferred to the radio faster than the radio could
accept it.
I reset the speed of the com port in windows to not go faster than 9600 and
the
problem went away. I use the software so much now I have a hard time
remembering how to program the radio from the keyboard anymore.

>
>My "agenda" ? I'll determine that for myself, Glen.

I didn't try to determine your agenda. I merely pointed out that you
do it (no matter what "it" is) no good by writing in this manner.

>> It's one thing to argue for your own ideas. It's another thing
>> entirely to insult someone else's enjoyment of the hobby, as long as
>> it's legal and in the spirit of ham radio.
>
>I have seen gateways damage the packet net for years, and have yet to see
>one do anything worthwhile in return. I don't consider setting up a gateway
>to be within the "spirit of ham radio", for these reasons.

But, of course, that's not what you said.

>It's still legal, for the time being, but so are a lot of obnoxious,
>destructive actions.

Such as yours, yes.

>This particular LandLine Lid wanna-be had also shown himself to be prone to
>spamming.. This makes him worth even less than a garden variety LandLine
>Lid, and those are not really worth the oxygen they take up every day.
>(IMHO)

But if that's true, you said nothing about that in your original
message, and in any case, namecalling does nothing but antagonize
potential allies to your cause.

>After having heard LandLine Lids denigrate amateur radio and packet radio
>every day for years, insulting and going on to directly interfere with ALL
>HAM's enjoyment of the hobby, I do not hesitate to discourage new LandLine
>Lid stations from being set up.

What next, mail bombs? It's still a free country, last time I
checked. If the wireline folks have a service to offer, let them set
it up and see if it'll attract enough users to be viable.

>Like it or not.

Makes little difference whether or not *I* like it. I'm only one
person. Thousands of others read your stuff here and on the BBS
network.

>If my actions interefere with YOUR agenda, I'm sorry about that. - But

Your actions have no affect on my agenda.

>still I will tend to let potential LandLine Lids know how I feel about what
>they are doing.

You can do that without resorting to insults.

I hope you're thinking about getting your license again! The answer is, both units, if functional are usable, but the selectivity on the Hallicrafters may not handle today's crowded bands. It would probably not be good for contesting or DX, but OK for ragchewing. I had a Johnson Viking I, and sold it before I left NY. Your finals are 6146's, which are not being made anymore, to my knowledge. They are still available from some outlets, though. I'm sure the transmitter will do well on CW, but the use of AM these days is severely limited. Surplus Sales of Nebraska may either provide you with parts if you need them, or suggest a market for antique rigs.

You're really not doing your agenda any good with this type of
message, Charles.

It's one thing to argue for your own ideas. It's another thing
entirely to insult someone else's enjoyment of the hobby, as long as
it's legal and in the spirit of ham radio.

My "agenda" ? I'll determine that for myself, Glen.

>
> It's one thing to argue for your own ideas. It's another thing
> entirely to insult someone else's enjoyment of the hobby, as long as
> it's legal and in the spirit of ham radio.

I have seen gateways damage the packet net for years, and have yet to see one do anything worthwhile in return. I don't consider setting up a gateway to be within the "spirit of ham radio", for these reasons.

It's still legal, for the time being, but so are a lot of obnoxious, destructive actions.

This particular LandLine Lid wanna-be had also shown himself to be prone to spamming.. This makes him worth even less than a garden variety LandLine Lid, and those are not really worth the oxygen they take up every day. (IMHO)

After having heard LandLine Lids denigrate amateur radio and packet radio every day for years, insulting and going on to directly interfere with ALL HAM's enjoyment of the hobby, I do not hesitate to discourage new LandLine

Lid stations from being set up.

Like it or not.

If my actions interefere with YOUR agenda, I'm sorry about that. - But still I will tend to let potential LandLine Lids know how I feel about what they are doing.

Yes the filters wired are correct from the factory.

ICOM changed the original specifications so the 706 did not receive
from 30 kHz to 200 Mhz due to some overload troubles in the VHF band.

There are a couple of amateur modifications floating around on the
net. In the United States ICOM could not apply these modifications as
doing so would violate the FCC Part 15 Type Approval of the receiver.

After just seeing ads for Icom and Alinco packet-ready mobile
tranceivers, I'm thinking about getting a 2m/70cm tranceiver with
built-in packet capability. The unit should have full cross-band
repeat capability.

What is the 'best' unit to get given that
the unit will be used primarily from my house?

What additional hardware (other than a computer) do I need to do packet
with these radios? What software?

What antennas work best?

URLs and/or FAQs dealing with these questions will be appreciated.

Thanks.

1615. A TS-570D editorial

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-17 00:00:00 UTC
From: hopewell@ctg.net
Message-ID: <869146002.10047@dejanews.com>
Source record: 170056

Howdy folks!

Here comes one TS-570D owner's opinions. Look out!

I can't believe all the posts I've seen lately, comparing Kenwood's TS-570D with the likes of the Yaesu FT-920 and ICOM IC-756. (Even a Ten-Tec OMNI!) I mean, really guys, let's try to avoid comparing Hondas with Acuras.

I purchased a TS-570D back in January after I went looking for a new rig in the mid-$1,000s. (My former HF rig had been a TS-850SAT which I had to sell a few years ago.) In early January, there were no FT-920s or IC-756s. All I had to select from was the TS-570D (not even the 6 meter "S" version was out yet), the IC-738 (which was on closeout) and the FT-900CAT. The TS-570D was the only radio in its price range with ANY sort of DSP, not to mention two antenna jacks (OK, so the IC-738 had two, but I didn't want to buy a rig that was being phased out), an RF gain control (none on the FT-900), built-in RS-232 port, auto notch, NEWER TECHNOLOGY, etc. To top it all off, QST gave the TS-570D a rave review in January.

I made my purchase and the TS-570D has been reliable and enjoyable. I haven't experienced any of the alleged "problems" reported on the radio. No memory loss, no lithium battery failure, nothing. I surmise that any TS-570Ds with problems must have been the VERY first ones off the line last fall.

In fact, my TS-570D has passed the ultimate reliability test. It was our club's main rig on Field Day -- it ran the entire 24 hours and was used continuously (even all night on 40

meters), and ran the entire time off of deep-cycle marine batteries. It didn't complain even when the voltage dropped to the point that you could see the display illumination dimming with voice peaks. (We then replaced the dying battery with a fresh one and kept on truckin'.)

In short, the TS-570D has been a solid performer. It cost me $1500, not $1800 or $2000. Now I've seen it as low as $1449. That's a big price difference! If I had wanted to spend more, I could have looked at the FT-990, Ten Tec OMNI or even a TS-870. But $1500 was the absolute tops for me due to my budget, and I think there are others who don't have 2 kilobucks to spend and are looking for a good mix of technology and economy. I'll tell you this, the TS-570D beats the pants off my TS-850S in operating features and extra goodies, and I've gotten nothing but excellent audio and signal reports using nothing more than an 80 meter dipole up a measely 20 feet at my townhouse.

Oh -- AF DSP vs. "IF" DSP? Maybe there's a difference, but hey -- it works! My TS-570D can pull signals out of the noise that I wouldn't be able to copy otherwise. And the DSP slope controls have been a godsend -- and really proved themselves on Field Day.

Yes, I'm sure the FT-920 and the IC-756 are excellent radios. The recent posts reflect that. And I'm not ignorant to the fact that the 570D lacks 6 meters. I could've looked at an IC-736, but again, it was $300 more expensive, and I didn't need 6 meters. (It's nice that Kenwood, unlike the others, gives us a choice.) But the TS-570D still has the market niche as the lowest-priced radio with all those features, even if they aren't all as high-tech as the ones on the 756. (I've read the specs and I see no difference between the TS-570D and the FT-920 except the 6-meter feature.) Kenwood has a technologically advanced,

solid and reliable radio for those of us whose budgets are a little more limited than others.

So go ahead and compare Lexus and Acura, but leave my Honda out of it. It's not an Acura, nor do I expect it to be one. But it's still a good car, and a heck of a deal for those of us who like to drive but don't need the heated seats and CD player.

(Please excuse the loose analogy!)

I'll be happy to answer any questions anyone has about the TS-570D.

I have a Kenwood TS-130s in excellent condition for sale.

It has the following features. WARC Bands. MIC processing, RIT, IF shift control, digital display as well as analog dial and noise blanker. It has a few other features as well. It comes with the microphone which also is in excellent shape and a heavy duty wiring harness. I have the original manual and packing material too if anyone wants to know.

As I said, this is in excellent condition with no scratches or mods. Anyone interested should email me at bluchunks@aol.com. $375.00. Thanks

Bob

Here is one more...
CTCSS decode is broke, that is, PL is needed to open the receiver (as
expected) but if PL disappears from the signal (used to eliminate the
squelch tail), the VX-1R receiver will not mute.

Congratulations! Welcome to the greatest hobby on the planet! I hold a technician class license and have been a ham for 2 years now, so I am pretty much a newbie myself. A friend and I studied together, tested together, and got our tickets the same day. He purchased an Alinco DJG-1T, and I purchased a Kenwood TH-28A. He had more problems with the alinco! Every other week something else was wrong with it. I have never had a minute's trouble with the Kenwood.

As far as an external antenna, I would say yes, you will need one. More so if you make do with just an HT for a while, as I have. I built a J-pole antenna from 1/2 inch copper tubing, and I can work repeaters up to about 50 miles away. It was very exciting building an antenna, and having it actually work!

Hi, David -
I also have an HTX-202, and have much the same reactions as Mike.
While I generally do not like Radio Shack merchandise (overpriced,
rarely up to speed technologically), these are good radios. They
cannot receive outside the 2M band, nor can they be modified to do
so, but they have very tight front-end filtering, and are much more
immune to intermod that many other handhelds. There are, however,
a whole new crop of budget handhelds, of which I know almost nothing.
Regarding the external antenna, I would recommend you build a
copper pipe J-pole and mount it on your roof. Plans can be found
in the ARRL's handbook (Radio Amateur's Handbook or their Antenna
Handbook). With my rubber duck, I can hit five or six repeaters.
Adding the rooftop J-pole gave me *28* repeaters with no increase
in power (the ~6W typical of an HTX202 on external power supply).
The most distant of these repeaters is about 60 mi away, and I was
hitting it with almost full-quieting. Yeah, this area is flat -
your mileage may vary, etc etc etc. Good luck!

Bob Lyons, KI8AB

1625. Opinions on Icom 2710

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-17 00:00:00 UTC
From: jeff@paradox.nol.net
Message-ID: <slrn5ssso2.9mm.jeff@paradox.nol.net>
Source record: 170066

Hello,

I am thinking about buying an Icom IC-2710 for my car. I was wondering if anybody had anything to say about this radio. I want to know if it will do the xband repeat and remote control like the 2700, and if it has the voice module. Also, Icom wants like $65 for a mic extension cable, is this cable nothing more than just a piece of 4-pair wire w/ RJ-45's on each end? Same goes for the speaker extension cable. Are there any mods for the 2710 also? The other thing is the microphone, is it as big as it looks? I have an Alinco DR-150T now and like its mic. I was just wondering if the Icom one is uncomfortable or bulky to hold.
Thanks.

- Jeff KC5IBY

1626. FS: FT-11R with accessories

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-17 00:00:00 UTC
From: dsnider@access.digex.net
Message-ID: <33ce21bc.153091059@news.erols.com>
Source record: 170067

I have an FT-11R (2M)with the low power battery, PA-10A mobile mounting kit, ADMS-1 software and interface (PC), E-DC-12 Mobile Charger, CA-9 charger, R/S Mic and MFJ mini mic for sale.

I have the original box and manual for the FT-11R and ADMS-1. The unit is in excellent condition. There are a few light scratches on the case. The LCD is clean.

Asking $300 for all. Available for inspection in the Wash, DC metro area.

> the Radio shack unit.
Which time signal are you trying to receive? If WWV, different
frequencies work better than others at certain times of the day because
of propagation conditions. A built in antenna shouldn't be used to
judge the performance of the receiver. A larger antenna, preferably one
outside should be used if possible.

From: Mitchell Hamm <n8xs@palmtop.net>
Message-ID: <33CE604B.3B00@palmtop.net>
Source record: 170069

I will also chime in with a positive experience. I have a TS-570S that I bought new at the Dayton Hamvention. It cost $1693 including tax and came with a free PS-40 switching power supply (and a Kenwood fanny pack, a nifty crystal paperweight, a Kenwood t-shirt and a nice mouse pad). :) I bought the PS-23 external speaker as an add-on.

Anyhow, this is my first serious assault on the HF bands and I have been very pleased with the 570. I am feeding it into a Cushcraft R7000 vertical and my main target has been DX on 20 meters where the big boys hang out. So far I have been doing quite well with lots of stations in Europe, Central and South America and Africa. With only 100 watts, I have to be a bit more clever to make a contact, but make them I do.

The receiver is just plain excellent. The DSP (whatever type it may be) does a fine job of pulling out weak phone signals. I have the narrow SSB filter and this helps even more when the bands open up on those rare occasions. Running barefoot, I can definitely hear a lot more stations than I can work.

The internal antenna tuner helps broaden the bandwidth of the R7000 on 40 meters where it is a bit narrow. Don't use it with a long wire as it only goes to 150 ohms (unless you are matching the wire with some other means).

I love the RS-232 interface. I use a logging program called DX4WIN and it integrated with the 570 with no problem. All features like frequency changes, scanning, spectrum scope, mode and frequency acquistion work just great. I have not built the little add-on CW keyboard interface, but am looking forward to trying that, too.

The internal keyer seems to work well though I am not a good CW operator. I have tried it with a Bencher Iambic and a Vibroplex Brass Racer.

The menu system is first rate and I rarely have to consult the manual for anything I need to do. And three cheers for those five quick memory slots; absolutely essential.

I think it is also a bit unfair to compare it to those higher priced rigs even though it compares favorably in many respects. It seems to have created a new niche for price/performance that the other manufacturers have not filled yet.

1629. FS: Johnson Viking II (it's back... sale fell through)

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-17 00:00:00 UTC
From: k5dh@qsl.net
Message-ID: <5qlnct$jqg@sf18.dseg.ti.com>
Source record: 170070
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment

For Sale (or maybe trade):

Johnson Viking II transmitter with manual (nice photocopy).
Operating condition unknown. Cosmetic condition fair to
good. Wear, scratches, etc, but not damaged or rusted,
and front panel looks presentable (a lot of scratches
around the edges of the bezel). Appears to be complete,
no obvious damage or modifications, all tubes are there,
but I haven't tested them. Line cord is the old rubber
covered type and is badly cracked and worn, so I haven't
tried to power it up (death is a permanent condition!).

This is the same one I had listed a couple of weeks ago,
but the sale fell through. I had several people contact
me about it. If you guys are still interested in this
rig... it's back!

Price $75, pick up only (north of Dallas, Texas).

email or phone me if you're interested.

73,

Dean Hemphill, K5DH

1631. Re: Best Mobile Dual-Bander?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-17 00:00:00 UTC
From: Paul Nicolay <paul_nicolay@merck.com>
Message-ID: <01bc92c3$9bd2e920$6e036536@merck.com>
Source record: 170072

Hi Dave,

As a Kenwood TM-V7E owner I can confirm that this unit is great. All the features I ever wanted are included in rig, except the sub-band mute. Since it is my first dual-band, I have never used sub-band mute, so I personally don't miss it. Other features build in are CTCSS en/decoder, alpha numeric display, visual band scanning (mini spectrum analyser), lots of memories (280), ...

About packet, it supports both 1K2 and 9K6 and this simultaneous with a QSO on another band ! So you can do packet on 70cm, and in the mean while have a QSO on 2m without one waiting/interferring the other one. In addition to the rig and a PC, you need a packetmodem and a cable to connect it to your transceiver. For software I use GP (Graphic Packte) which is nice and works fine.

The antenna I use is a Commet GP6 and also performs excellent and has as high quality mounting system.

Sorry I can't compare the transceiver with the Icom and Alinco ones, but so far I haven't found a reason why I should by another one.

73s ON1DJU,
Paul

Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.swap

I have a FTDX100 for sale. This is probably the pedecessor to the FT101. It is a solid sate rig with tube driver and finals. It is more like the FTDX401 in case style but with a black face. It is in excellent condition. Works great except the 40 meter local osc. crystal is intermittent. (could be replaced for about $12) I have the original box and original manual in Japanese and I have a copy in English.

This is a rare radio... at least I have never seen another one.

Make Offer.

If interested call me at 520-284-6848 or e-mail nu6x@sedona.net

Try contacting Communication Specialists located in Orange, CA.
Comm.Spec has tone replacement units for older Kenwood radios. Don't
forget to ask for the installation instructions for specific models.
There is a toll-free number, call 800-555-1212.

1645. Looking for docs: Japanese version of TS 520

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-17 00:00:00 UTC
From: raoul@olympus.net
Message-ID: <raoul-1707971820070001@news.olympus.net>
Source record: 170086

Hello-

I have an opportunity to obtain a Trio TS 520 D xceiver. It it supposed to work and the price is very, very attractive. I do realize that Trio and Kenwood are the same thing and that Trio was the name used in Japan and on all older Kenwood rigs.

I believe it is the "home" version because the manual is written in Japanese and it has the "D" suffix. I'm not able to figure out much from looking at the manual, but am able to find out some things by looking at the schematic. Because of the nature of Japanese documents, some of labelling on the schematic is in English and, of course, the numerical values are in Arabic figures.

It has what appears to be a 13.5 VDC adapter on the back and the schematic suggests this is possible. There is a box labeled "DC-1" on the back and the power plug has heavy gauge red and black wires coming from it. "13.8 VDC" is stamped above the power plug. In addition, there is "100VAC 50hz" stamped above the power plug, which is what the home standard voltage is for Japan.

I'm going to use it in the USA and wonder if there is some type of jumper or "adjustment" to be made to have it run on 120VAC 60hz power which is standard in the US.

In short, I'd like to get an English copy of the manual and find out what I need to know to use this rig in the US. In lieu of that, I'd like to get a manual for a TS 520- US version to understand how to operate this rig.

thanks in advance-

Jeff (KB7AIL)

> 73 CW OP

I'll add a few more items to the list:
1) if you check the mode when in BC mode it says fm?
2) You can't scan different bands, only a single band plus the priority channel.
3) I have heard reports of the deviation is very hight.

Yaesu, is awaire of most of these items, but has no answer yet.

Dennis, you should be able to answer this question too. Does the
ZEIT allow the 'auto DST' adjustment to be turned OFF? We don't
have daylight savings time in AZ (save time in the heat? Never!)
and I'd feel like they were picking on my if I had to reset the clock
twice a year. Thanx!

Ok I still have the following items for sale and will
now take bids. I will take bids for one week and
will sell to the high bider.

1- Palomar Antenna Tuner PT-2500 with built in noise bridge.
This is a 2kw tuner.

2- Icom IC-22S 2 meter mobil with diode matrix. Would make
a great second rig.

I do want to thank everyone that responded to the first
post. My garage is almost clean again...hi hi.

In article <5qmt9c$92p$1@excalibur.flash.net>, "Christopher M. Rutledge" <rutledgec@geocities.com> writes
>Has anyone ever used or heard of anyone using a parabolic antenna (Satellite >Dish Antenna) for working any of the AMSAT birds? Seems like the gain would >be nice but are there any problems with polarization and how about the mesh >width? - i.e. would a plain old 10' C-Band TVRO dish work for xmit? or would >the signals pass right through it?

Hi Chris

Follow some of the links from my web site you will find plenty of info on parabolics.

The problem with a big dish will be:

1> surface accuracy at required freq. No lumps can be bigger than 1/3 wavelength or you get squints

2> solid or mesh? If mesh the holes cant be bigger than 1/10 wavelength wide or you get losses

3> pointing accuracy required. A big dish might need a pointing accuracy of 3 degrees. Pretty hard!

I would go for a smaller dish, say 1M - perfect gain for higher bands, reasonable pointing accuracy and easy to control.

Polarisation, depends on what satellite, but normally circular - simple helix feed at the dish focus for 2.3/3.4 and a horn with phasing adapter for 5.7 and 10 ghz.

I think you must be gearing up for 3D.

Let me know more, I maybe able to help.

How many of you would pay $30 (postage included) for the plans to build
a PROFESSIONALLY designed 12 Element 2 Meter log-spaced quad, a little
under 20 feet long and build on a sturdy aluminum boom, with 17-21 dB of
average forward gain, giving you an effective radiated power of about
200 forward Watts RMS for every 10 Watts RMS of input to the antenna?

If yes, please go only once to this URL:

http://www.caprica.com/~jd/yes4quad.html

If no, please go only once to this URL.

http://www.caprica.com/~jd/no4quad.html

To see pictures of this antenna, finished and installed, click here:

Hi all,

My homepage is getting bigger and will continue to do so until Telenordia tell me I have run out of disk space on the server. Since the last list I have almost finished my General Coverage receiver, and it works a treat. I have added a 10 (15) watt HF linear amplifier, complete with the PCB foil (uses the cheap CB type PA transistors).

I have even included a couple of pages about 'estimating' size of heatsinks. Visut my page at:

http://user.tninet.se/~acz732k/

Amongst my constructional projects are:

BASIC INFO FOR BEGINNERS
How to solder
Component identification
tools
How to calculate heatsinks

ANTENNAS
Remote tuning of tuneable antennas
Basic dipole information
Short antennas for the HF bands
A balcony/terrace antenna (worked JA on it)
Packing crate antenna
Frame antenna

RECEIVERS
General coverage HF receiver
Cigar box HF receiver - uses battery valves
IC HF receiver
HF direct conversion receiver
Regenerative HF receiver
HF and VHF receiver using ZN414 (ZN416)
Modifying domestic receivers for HF SSB
Modifying domestic receiver for 160 meters
Synthesized receiver

TRANSMITTERS
FM (88+108MHz) 'BUG' (can be modified for 30 MHz)
250mW HF bands CW TX
4 watt PS for the above

5 watt CW TX - dead easy to build
CW TX using voltage regulator
Single valve TX
Two valve TX
Cigar box transmitter (valve)
145MHz FM TX
QRP SSB TX
3 watt linear 1 - 30 MHz
Phasing method SSB exciter
500 watt linear amplifier
April 1st transmitter
10 watt linear amplifier (30dB gain)

USEFUL
VHF NBFM Crystal RX based on a coffee tin
250vDC for valves using modern components
Stereo enhancement for HF CW
CW filters
Self tuning CW filter
Q-multiplier
CW keyer using 'relay logic'

DATA/INFORMATION
QRP frequencies
Measuring micropowers
Making PCBs, several methods
G0TLAs QRP circuit database on packet
Coil winding and 'turns' calculation.

DOWNLOADING
Signal generator program
All my QRP@WW circuits in a ZIP file
PCB foil for BUG TX (later version)
'Adult' screen saver

BREWING BOOZE
Brewing beer, wine and 'mash'
Distilling the mash (3 methods)
Making liquours

---------- and more ----------

I will be adding more to the homepage constantly, as long as
I have the time available to do it.

Have fun with QRP (and QRO) de Harry, SM0VPO, Upplands V&#65533;sby.

: The problem is the FT-900 has a female RJ-45 mike connector and I dont
: know how to wire and have no crimping tool.

You can make one by getting the appropriate socket you need (8 pin
or otherwise), and then getting a good quality ethernet patch cable.

Cut off the end you don't need (or cut it in half for two), and then
solder the socket on the end. Check your Yaesu manual for pinouts.

I made an adapter for FT900, and it works great. I also use my Heil
headset with my FT920.

Were you using the diode checker or the voltage section on the
multimeter? I think you have to remove the transistors from the circuit
before you use the transistor checker.

Well, if the antenna were professionally designed, you would certainly care
to specify the gain a little closer. If it were anywhere near the quoted
figure, many EME-ers would immedially throw away their arrays.

In fact, there is no reason to believe that the gain exceeds that of a
typical 20 ft yagi, at about 13 dBd, the plans for which are *free*.

> 73,
>
> Rick WB9GYT
> Milwaukee, WI

i agree although i would choose the 2m to 6m transverter because i like
the fm
area more. the 2 to 6 unit covers 50-54 mHz. granted you would need an
all-mode
2m to use the ssb portion. the cost is the same. 99 bucks in kit form

i run an ic-706 into 3 antennae. 1ea radio shack 2m on the 2m port, comet duplexer on the hf port feeding a wilson 'lil wil 10m mag mount and a 6m hamstick.

all swr were at 1.5 or so. now check this:

my 706 would stick in transmit mode in 6m. just 6m nowhere else. after racking my brains and blaming the radio, i felt the duplexer. it was hot. the thing was rated 600w pep and my radio does maybe 90w in the car. it was hot anyway. i pulled the 'plexer and hooked up just the 6m stick. adjusted the antennae swr then keyed her up full power for 2 minutes or so. this time the radio unkeyed when i let go.

so the culprit is the 'plexer.

has anyone had similar experiences and if so, what do you suggest i do to rectify the situation.

my 706 usage is fm repeater work on 2m,6m,and 10m. hence the antennae configuration.

thanks!

Yes there is an adapter to 8-pin. Model CT-26 es costs aound $20 U.S. I found I had to change a couple of pins on the 8-pin end to adapt to my MC60 but lots better than having to play with the other end, hi.

Good question, I'd be interested in knowing this as well. I do know a few folks with the ten-tec transverters and they like them a lot. I'm thinking of getting the 20 meter model.

Got one here that doesn't work right on packet transmit right now, only generating the high tone, no low tone. VHF packet that is. Works all other modes and recieves packet ok. I have so many TNCs around here that I have decided to get rid of it. Has 128K mailbox memeory and the extended mailbox mod done. No pactor, too old for that. I have the original manual (a darn good sized book/with schematics in it) and the original box it came in. The wall wart power supply croaked a few years back, but it runs on any 12VDC supply with very small current draw. Make an offer or what have to to swap. I could use a 440 rig, at least 10 watts output. Diode matrix or synth if possible. Crystals get to pricey to buy. Drop us a line as we are always looking to do some swapping here.

The radio will not receive cellular but do the following:

Turn off the radio
Press and hold the band and squelch buttons.
Turn on the radio while holding these buttons, wait for 5 seconds
before you release the band and squelch buttons.

Now the receiver should be opened up as far as it will go.

Hi, have you tries resetting the squelch to a value above 3 or so? I think the radio 's default for Sq setting is the "auto" mode. I think this is a rather "loose" setting that is based on an internal preset(sw?) or is RSSI derived.

Ques: Have you tried scanning memory CHs that require PL tones? When I do this on my VX-1, it scans past these CHs. I have tried it with high and lower freq PLs and on both VHF and UHF bands. I do have the scan resume set for carrier drop. I ahve tried high and low and auto Sq settings. The radio has no problems with decoding PLs(and resetting) when it is stationary on a given memory The radio will lock onto a mem that programmed for a DCS code
thanks

1701. Parabolic Antenna For AMSAT Work

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-18 00:00:00 UTC
From: rutledgec@geocities.com
Message-ID: <5qmt9c$92p$1@excalibur.flash.net>
Source record: 170011
Cross-posted to: alt.ham-radio.vhf-uhf,rec.radio.amateur,rec.radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.space

Has anyone ever used or heard of anyone using a parabolic antenna (Satellite Dish Antenna) for working any of the AMSAT birds? Seems like the gain would be nice but are there any problems with polarization and how about the mesh width? - i.e. would a plain old 10' C-Band TVRO dish work for xmit? or would the signals pass right through it?

Thanks In Advance -

Chris Rutledge

hello, All.

Im going Kayaking next month and hear that there is a small packable
2m/440 bean called an Arrow antenna (made of arrows from 'bow and arrow')
that is very packable and easily used with a dual bander HT. I am looking
to contact AO-27(?) as someone told me this is pretty easy to do.

Any info would be greatly appreciated.

Thanks Gary, but I'm looking for how to field program the radio. i.e.,
through the keypad, not a computer. I know for a fact that it can be done,
I just don't yet know the magic code.

Thanks anyway.

Depending on the frequency, a TVRO dish could work well for you, the mesh is designed to work at frequencies of up to 4 Ghz. As for gain, at 432 mhz, a perfect 12 foot dish has a gain of about 22 dB over an isotropic radiator, according to charts in the ARRL Antenna Book. A 10 foot dish has a potential gain at 432 Mhz of about 20 dB, i figure by interpeting the charts. At higher freqencies, the potential gain is even higher.
At 1296 Mhz, that same 10 foot dish has a potential dBi of about 26 dB, and in fact people have used 10 foot dishes for EME work at these frequencies.
At lower frequencies than 432 Mhz, a dish becomes impractical. A 10 foot dish at 144 Mhz has a dBi of only 8 or 10 dB, a figure I can equal with a homemade 4 element Quad.

The ARRL antenna book also has ideas for building feedhorns for dishes, and other ideas. Good luck and 73

I've thinned down the newsgroup list a little -- hope you see this.

Basically, junker computers are nearly as good as junker
vacuum-tube TV sets for ham radio parts sources. You have to
be willing to dig.

I've heard of people successfully pulling ICs off of soldered
boards, but personally haven't had great luck. The capacitors
come off easily enough with a soldering iron and are well
worth taking. Any of the TTL or CMOS discrete logic chips
are worth taking if they'll come along easily -- I haven't found
the magic technique yet.

I've tried these methods --
o Heat the solder side of the PC board with a blow torch
(Chip packages seem to melt before the solder)
o Solder wick
o Desoldering gun/"snot-bottle"
I haven't tried making a desoldering tip the size of a DIP IC
for my 100-watt iron yet -- maybe that'll work. I've also seen
people in the electronics salvage industry use a bed of heated
sand, drop the board on the sand, and pick chips off with a
chip puller. Might work....

The memory probably isn't worth messing with, same with the
8086 and controller chips. If there's an 8087, it's worth
taking -- people will still pay a couple bucks for one of these.

Inside the power supply -- there is at least one hi-voltage,
hi-capacitance filter cap VERY suitable for use in an HV
power supply. You'll need four of these (at least) to series
a filter cap bank, but the voltage range is typically 250 to
400 volts and it's drilling apart a power supply. There's also
a nice fan -- and it always amazes me to see people spend
$3 for a fan but pass up a 25-cent XT power supply. The power
supply has the best stuff -- hi-watt resistors, some toroids,
the capacitors, and some potentially useful switching transistors
that should work on 80 meters.

Happy hacking.

Gary,
I agree that we should post "for sale" items on the swap group.
However, when I first joined these two groups and began reading
them, it did not seem clear that "equipment" does not mean "for
sale."

I believe that is much of the problem.

I was seriously considering this radio myself, but I ended up getting the Alinco DJ-G5TH for $359 with free
shippinh from HRO. That is a 5 Watt rig. I believe the 5 Watt version of the AT-600 is about $339, so there really
isn't much of a price difference. I was a little reluctant of buying a rig made in Taiwan with from a company with
no real track record. Yes, the AT-600 covers *PART* of the 800 MHz range (current versions only cover above
895 MHz I believe). Otherwise the Alinco has about the same features and a few extras.

Probably talking about as far as you can hear now. Usually its not worth
getting an amp unless you go up 10db. Money may be better spent on a
better antenna.

The squelch tail eliminator systems I've seen used in commercial gear doesn't eliminate the PL tone, but the TRANSMITTER sends the tone 180 degrees out of phase when it unkeys for a split second. The receiver recognizes this fact, and mutes the receiver (muting does NOT turn it off), elminiating the squelch tail.
That's why a Motorola radio will not squelch mute on a GE commercial ham repeater. It's squelch tail elimination system is slightly different that the ones used on GE stuff.
A good similar example of this is a ham repeater with PL. If someone transmits with the wrong PL, it will not open the TRANSMITTER at all. If you are at the repeater site, and have a speaker on the receiver, you'll hear the guy talking away (Receiver is still active). Many think you're not opening up the receiver at the repeater, which is furthest from the truth...

>N8ZCC

It was my impression that this is how CTCSS is supposed to work.
The squelch is opened only while the tone is present (continuous).
The DCS methode (with dtmf tones at the start of every xmission)
is the one that opens the squelch and leaves it open for the
duration of the xmission.

I had one up for several years---loved it. I had a neighbor a few blocks away to had a TH6DX-same height, same equipment, same power. I consistantly outperformed him, usually getting signal reports of 1 to 2 S-units higher than he did. We had a good friendly revialry going-chasing DX. I sold the quad when I moved and Hy-Gain had quit making them---too bad.

BTW, I followed the instruction EXACTLY and the quad was exactly resonant where I wanted it. I had it on a low tower, 33" at boom height.

The FT-50R can do this, but you can't monitor the repeater's output as
you are transmitting (but some other "true" dual-band radios can).
You don't need the ADMS software to program it. Each memory channel
can have a completely seperate transmit frequency instead of a regular
repeater offset.

I agree. The only gripe I have about it isn't particularly ADI's fault; the alkaline battery case (marked 9V Battery Pack SBC 146) fits the ADI-600 but obviously was made for some other radio (Standard?) - it's a slightly different color and doesn't fit the outline of the ADI-600. The normal NiCd battery case is perfect. Other than that, I can't keep my hands off the radio! As far as being made in Taiwan, a lot of your computer mother boards are made there; their electronics quality is as good as anything else made offshore.

> > I am comparing and contrasting the Kenwood TM-V7 and the Yaesu FT 8100.

True, the Kenwood does have more bells and whistles but here are the comments from 5 owners in this area. Terrible intermod problem. At least as bad as the TM 733 which was almost unuseable in city areas. Even bad outside the city where there are pagers. Outdated circuitry here with no improvement Can hardly see the numbers and other display and it isn't even very bright outside. Pretty blue but surely not very readable during the daytime. I love the lotsa memories but my gosh it makes a career out of scanning through them. Scan rate must be 4 or 5 channels per sec. My ten year old scanner is 5 times as fast as this. Three of the 5 hams are trying to sell theirs and they are not moving at an asking price of $400 to $425. There is a way to adjust for the intermod but it's through attnuation (Icom does this too) and it works to a degree but your middle strength repeaters go to S1 or 2 and your weak stations disappear completely. Even if you install a good intermod filter like the DCI, you still have the disasterously slow scan rate
The Yaesu FT8000 and FT8100 are the first mobiles to incorporate intermod protection built into the IF stage and while it's not perfecft, it is way above everyone else. Driving through downtown Mpls - St. Paul, there was only 2 areas where intermod started to break through and then cut out. The Kenwood could not even be used in the cityies. The display is easier to read than any other unit that I have had. The scan rate is great 26 channels per sec. approx. All 54 channels scanned on the FT8000 in less than 3 secs. Don't know where the repeaters or police action is? Put the unit in search scan. It stops on a station and automatically puts it in a special ghost memory which you can check later and leave there or put in your regular memory bank. The 10 hams I know and myself who have 8000's or 8100's are all pleased with the performance and 2 have bought second ones compared to the 5 hams with the Kenwoods who are all unhappy with 3 trying to dump theirs
The FT8000 has been discontunued because it is too easy to open up the 800 cellular but there are still some available.
Just a final note, I wouldn't trade any of my Kenwood HF gear for any other brand.
Hope this helps a little,
73 es gud dx,
Bert K0BTF

Some transistor testers work on installed components, some don't. In any event one leg (any leg will do E, B, or C) of the device to be tested is all that has to be disconnected.

Tom

> Regards Andrew Laity VK3AHD

Great radio, but it is being phased out by the new model 8100R.
The difference with that is that on the 8000R you don't have:
more than 49 channels for VHF or UHF
detachable face plate
Power settings 5/25/50 (instead of 5/10/50)

Other than that I love mine..... Yaesu makes great products.

there is a difference between "pirate" radio and low power legal
transmitting.

i'm sure that others will post the correct fcc guidlines for legal
transmitting in the broadcast bands so i won't go into it.

you can get either an fm or am broadcast band transmitter kit from
Ramsey Electronics.

inexpensive and within the legal limits.

I will compare my IC-2000H to a friends IC-2000H side by side to see if
there is a problem. BTW , the construction of the UNIT is FIRST RATE.
I just opened up the radio to see what the guts look like. Some of the
other brands of seen use poor construction.

Does anyone know the modification for the TH-79A so that it will receive 800 MHz band. I know the other mods for the other bands.

Can this radio transmit on avaiation bands? I am a pilot and this would be very convient.

Thanks,

Gary,

What is the source of these instructions? The guy at tech support kept telling me that the switch should be in the "other" position. I have a feeling he didn't know what he was talking about, though, because I kept asking him about the front panel switch, and he said not only that the switch should work, but that it should indicate when the tuner is working.

Thanks for the info. This clears up a lot of things. Just wonder if any of the menu functions of the IC-706 need to be changed.

Hi mate,

Re removing ICs. Some years back myself and a bunch of other folks in a ham club were given a pile of Burroughs PC boards loaded with a now defucnt CTL logic family (an early current mode logic). In an effort to recover the stuff (1970) we tried many trick and finally the late K6OIK, Len, came up with a scheme which I modified slightly. The trick is to find an old American Beauty soldering iron that takes a copper slug type tip (approximately 3/8 inch diameter) and then fashion new tips from 3/8 inch od copper tubing. Then you can hammer out a nice sharp flat end the width of the chip you want to remove. No attempt was made to save the multi-layer pcb, but by applying the heat with a sharp edged and tinned heating tip that hit all pins on one side, we were able to pop the chips off one side at a time with a little prying action. We rarely lost a chip, but did pull a lot of thru-holes with the chips (no big deal).
The process was not pretty nor delicate, but when TTL was selling for a couple bucks a piece for JK flops, it sure got a lot of projects off the ground. The tip required continuous trimming and filing and hammering, but it was a cheap tool and easy to make new ones. The key was keeping the tip/blade sharp and square cut.

Consider the JBI interface kit at http://www.apci.net/~jbi/
John maintains a list of compatible radios that he has personally
verified works with his interface. Although operation with the IC821H
is not listed, Icom has probably made the 821 radio similar to their HF
radios. If you have any questions, he is at jbi@apci.net.

My thoughts here is that Yaesu , wanted to get thr VX1-R
into the market ASAP to get part of the market from Standard,
but with all the software flaws, it make Yaesu look bad.

I would certainly buy another VX1-R , if they fix the bugs.
The FT-50R works good in Tone Squelch, even for general receive.

Its's PL decode is broken in the 170-222 and 470-800. If
Yaesu fixed mine, I back them up 100% on their new VX1-R.
I sent them a FAX, left a Voice message to customer service,
got no answer, at Yaesu USA.

Be willing pay the technician his hourly rate to put in a
fixed CPU, but I guess they are not to responsive to
customer satisfaction.

I guess all I wanted was for them to call me, let me
know when the new firmware was in and pay a minimum
service charge for CPU upgrade.

I may sell this at a loss, then wait many months hoping
Yaesu fixes the firmware and buy one one the bugs get
fixed,
No power saving and no PL decode in the two bands
170-222 and 470-800

Heil makes adaptors that work with most
modular-connectorized radios ... the proper
one for your FT900 is the "AD1YM" and is available
from Heil dealers for about $15.00.

Easily done ... we have a customer who visits Las Vegas
regularly, and works AO-27 from the parking lot with his
Arrow Beam.

This experience with him is the major reason we started
stocking these neat, nice antennas.

The antenna is light (all-aluminum construction), and has a
cushioned hand-grip at the back end for ease in holding in
hand and manually tracking the bird.

Congestion on "the bird" is going to be something to
consider, since it is a "one-channel repeater" - one
conversation at a time. However, that far north, you won't
have a lot of competition around you - just from the south
of you!

Very 73, and good luck!

Hello All,
Called Yaesu and they sent me the new power knob for the ft50. Looks like the one from the radio. the part number i got is R3521630 'FT-10/40R power knob replaced R3521630A'
Is this the right part as I hear a lot of people have been sent the same part that is already in the ft50!!!!

Second, any hints on getting this radio apart? the mods were bad enough. Let me know how to install these new knobs....just hope I don;'t have to take it apart more than once for this!

Thanks!

Here's some other information that might help, excerpted
from the

"Amateur CW/Voice Satellite Frequencies for July 14, 1997.",
posted regularly on the rec.radio.amateur.space newsgroup:

==========

AO-27 J-FM* Uplink 145.850 FM
Downlink 436.792 FM

==========

* Please note Amsat Oscar-27 has a very sensitive receiver,
I have routinely uplinked to it with a handheld on low
power. On the other hand reception of the 70cm downlink
signal is more difficult without a directional antenna
most of the time. Therefore it is important to make sure
that you can hear the satellite downlink before you transmit
therefor avoiding interfering with others already on this
one channel satellite repeater.

==========

The latest update of this list may be found at these
locations:

Web.....http://www.umecut.maine.edu/~baack/freqguide.html
Newsgroups...rec.radio.amateur.space
....aus.radio.amateur.misc
....uk.radio.amateur
Mail List....amsat-bb@amsat.org

And of course, a visit to Amsat's web page at
http://www.amsat.org
will be most enlightening!

Best of luck!

You can also make one up out of a 10-Base-T Ethernet cord - just cut in half and splice the necessary wires (the wires on the 10-Base-T aren't shielded but the connector is the same).

Hello,

A week or two ago someone posted about common problems with a Radio Shack HTX-202 and I think one of the problems had to do with the speaker. If you have the post or know where I can get it, I would appreciate a reply.
I have audio but it is VERY low. Even if I plug a speaker mike into the plugs on top, it's a little louder but you have to hold it up to your ear to hear it. Everything else seems to work.
Any help would be appreciated.

U.S. Tower 72 ft heavy duty motorized crank-up. Comes with limit switch package, heavy duty raising fixture and tower mounted work platform. Will easily handle 15 to 20 sq.ft of antenna. The tower is up and operational and is available in the Tampa Fl area. This tower nests at about 22 ft. and can be trailered for some travel. This is the Rolls Royce of residential type towers. Only $2750, a steal at this price..... House with pool available for some additional money...Move to Fla.....

I just wanted to thank everybody who responded to my post regarding what to do with some old amateur gear I have from the 50s/60s. I appreciate the kind words and encouragement offered by many. I think I will probably save the gear for now, but if I run accross any other items which may have collectors value I will share them with you. Thanks again.

p.s. Through that post I was also able to come in contact with a fellow radio amateur from my hometown in PA who I have not seen in about 35 years!!

What a hobby!!!!!

john, the answer to your question, is yes the ft50 will link to a cross
banded repeater just fine. remember, on yaesu radios in cross band
mode, they still toggle fron transmit freq to recieve freq
automatically. so, you wont need the ft 50 to transmit both feq, just
one, the cross banded radio does the rest. i hope this makes sense, if
not write, i will explain further. i have done this.....

My off the cuff answer is "Line of sight".. I'm not being a smart ass,
its the best answer. If you are up high enough you'll be able to work
MANY miles. On the other hand 340 Mw isn't going to penetrate much
earth (hills). On flat terrain both rigs using rubber dummy loads
About 1/2 Mile. Put good 1/4 wave antennas on 1 mile or so pretty
easy. Good base type antennas and towers 25 or 30 miles. good luck!

1789. Maha Desk Charger

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-19 00:00:00 UTC
From: Bill Smith <bs@BSartist.com>
Message-ID: <01bc9449$ed8e9840$b22563c7@scobee.wan.gs.com>
Source record: 169917

Folks,
I just started using the MAHA MH-101 desktop fast-charger for my fairly new FNB-41 NiCd Yaesu battery.

When I plunk a fully discharged (radio won't stay on) battery/radio in the charger, it starts blinking (switches to trickle charge) after about 10 minutes. That seems way too fast - I thought it would be about an hour. Although the display on the radio indicates it's up to 10 volts, I don't get much time out of it unless I leave it on trickle for awhile longer.

Can anyone comment on this behaviour?

Bill

1790. Re: AT-160 with IC-706

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-19 00:00:00 UTC
From: gfiber@news.cmc.net
Message-ID: <33d0db8a.5029108@news.cmc.net>
Source record: 169918

>Jim N2ZZ

I guess that page has not been released yet. Here is the write up

Gary

AT-160 and the IC-706 Operation

NOTE: The AT-160 will NOT operate with the IC-706 MKII. The problem is the AT-160 causes the 706 MKII to transmit constantly on VHF. This is because the 706 MK II also now has a VHF key line for VHF amplifiers and the AT-160 places a ground on this line when used with the OPC-599 adaptor cable.

Open the AT-160 and make sure the switch labeled S1 on the circuit board is to the switched to the bottom, shown as " IC-725/726 " in the AT-160 instructions.

Make the correct connections to the AT-160 using the OPC-319 , OPC-104, OPC-125C cables are connected according to the AT-160 instruction manual.
It is suggested using the OPC-599 adapter cable for connection of the OPC-104 to the IC-706.

Connect the radio to the transmitter terminal, connect an antenna to the ANT terminal. Make sure the antenna has less than a 3:1 SWR. Place the radio in FM, AM or RTTY mode and key the mic. The AT-160 now will tune properly.

*** The tuning button on the front of the IC-706 will not operate when using the AT-160 tuner. It was designed for use with the AT-180 tuner. ***

Check the SWR presented to the radio, it should be less than 1.5:1. The AT-160 operates with the IC-706 as it would with the IC-725 or 726 radios. Included with the AT-160 instructions is a page dedicated to it's operation with an IC-725 and IC-726 radio. This is the way the AT-160 operates with the IC-706

There is no way to turn off or place into " thru " mode the AT-160 when operating with the IC-706 transceiver.

Following the above instructions should result in satisfactory operation of your IC-AT- 160 with the IC-706 transceiver.

I hate to go through life always feeling like a victum, but you'd think
after 50 years or so I would be used to it (-:

Here's the problem. I purchased a Standard 508 ht at Dayton this
year. The wide-band transmit mod was done on it, and it seems to work
fine, but being the HAM type of individual I am, I thought it would also
be nice to have the 800 mhz recieve as well.
After opening the rig up (I hate to think of anything as a rig thats
smaller than a mic!) I find that a component has already been removed
that's in about the correct spot to be the wide recieve mod, but isn't!
They popped off the wrong device!
Question is, what's missing, and what's it do? The radio like I said
seems to operate correctly without it, but I'm not sure it's performance
isn't suffering in some way. Here is the drawing:

The instruction manual for the IC-821H describes the CI-V command set for the radio. The interface requires a Bi Directional serial port at TTL voltage levels. I would not recommend attempting a direct connection between the IC-821H and your PC unless you have a serial port that is at TTL voltage levels 0 and + 5 volts D.C. respectively.

May be there are new transmitters in your area now. This may cause
an external mix which might either overload or cause an image response
in your radio.

> KK5MI

The noise blanker on my dx70 hi power rig works better than the one on my ic-706. With the included cw and ssb filters, the rig's receiver is actually better out of the box than many other rigs i have owned. I find that switching the noise blanker on along with the very effective narrow filters works as well as anything this side of a digital signal processor (except for the noise blanker on my former yaesu ft-757(superb). Of course, there are some forms of noise that the dx70 blanker does not touch, but that is the case with the Icom as well....AND, the rig is obviously not as quiet as a quad-conversion receiver rig. This is the first rig i've owned in a while that is really a joy to operate. I'd get one before Alinco decides to improve it by putting in more computer chips. Unless you get dsp with them, my experience is that the more radios use microprocessors, the worse they get. also, I get TREMENDOUS reports from persons i work on audio quality, etc. AND...receiver does not drift with the warming up and cooling down as does my 706, and to a lesser degree, my kenwood 450-s.

There is a new law in in Congress that DIRECTLY affects the radio hobby. Edward Markey (D-MA) has introduced bill H.R. 1964 that will stop new radios
from picking up a whole bunch of VHF and UHF frequencies. This stupidity must be stopped or I bet all scanners will be banned in the near future. Where
these idiots get off telling us that there are frequencies that should be forbidden
is beyond me. Shows what the power of money can do.
The last time a bill came along like this cellular frequencies got banned. This
time we have the power of the Net to spread the word. Please let others know
about this bad law. Also write now to your Congressman and let them know what
you think of this.

Date: Fri, 11 Jul 1997 11:33:34 -0400

From: Larry Van Horn <steditor@grove.net>

Subject: Legislative Alert: Scanners Under Attack HR 1964

First I would like to thank my old friend Larry Miller of Monitoring Times and National Scanning Report for the heads up on this bill that is moving
through Congress.

I have some bad news that DIRECTLY effects the radio hobby above 30 MHz. I'm not going to wait on the presses here at Grove to roll
because this legislation needs to be stopped now before it gets out of
committee. Should it pass, this bill will end the scanner hobby as we know it.

Another assault on the scanning hobby has begun by Congress and our dear, dear friend the honorable Edward Markey (D-MA). Markey has introduced H.R.

1964. This bill in section 104 makes major changes to Section 302 (d) of the
Communications Act of 1934 (47 U.S.C. 302(d)). Most of you who are students of the cellular telephone frequency wars should remember this section. If not, let me refresh your memory. This is the section of US Code that prohibits the manufacture of any scanner capable of receiving the cellular telephone bands.

Well Markey has taken this to a new level with H.R. 1964. If passed the new
language would now read:
(a) The Commission shall prescribe and make effective regulations denying
equipment authorization (under part 15 of title 47, Code of Federal Regulations, or any other part of that title) for any scanning receiver that
is capable of:

(1) receiving transmissions in the frequencies allocated to a commercial mobile radio service (as such term is defined in section 332(d));

(2) readily being altered by the user to receive transmissions in such frequencies, or

(3) being equipped with decoders that convert digital commercial mobile transmissions to analog voice audio.

(b) Effective Date of Prohibitions on Regulation Amendments -- The prohibitions contained in section 302 (b) of the Communications Act of 1934
shall apply with respect to the changes made by the Federal Communications
Commission in its regulations to implement the amendments made by subsection

(a) of this section beginning 1 year after the effective date of such changes.

On the surface this looks like a yawner. But let's dig a little deeper into
Markey's bomb shell and see what it really says. What is the commercial
mobile radio service or CMRS?

From Bennett Z. Kobb's Spectrum Guide let's see what frequencies this effects. Comments in parenthesis are mine.
"The FCC is changing the terminology it traditionally has used to classify
radio services. The new terminology is somewhat more opaque. An

essential
distinction is between PMRS and the commercial Mobile Radio Services
(CMRS).

Licensees of CMRS businesses provide for-profit, telephone
interconnect
(mobile and portable telephone or dial-up paging) service to the
public.
"Examples of CMRS include private paging services (except for
not-for-profit, internal paging systems); Business Radio Service
Systems
(anything with an IB designation in the Police Call consolidated
frequency
list folks-Larry); Specialized Mobile Radio (SMR) services (this hits
the
851-866 MHz band and that includes most the comms that the new trunk
tracker can monitor including the majority of the public service
agencies using trunked systems); and 220-222 MHz land mobile
systems, to the extent all of these offer for-profit,
telephone-interconnected service to the public;
Public Mobile Services such as Paging and Radiotelephone services
and the
Cellular Radiotelephone Service the 454 MHz and 800 MHz air-ground
radiotelephone service; the Offshore Radiotelephone Service; most
types of
mobile satellite services; and the Personal Communications Services
(PCS).

"Previously, most for-profit mobile services were called "radio
common
carriers." This term has not completely disappeared from use.

"Recent legislation brought all for-profit mobile radio services
under the
CMRS umbrella. Some former PMRS services were reclassified as CMRS
because they are largely devoted to for-profit service with
interconnection to the public telephone network. In some cases PMRS
and CMRS operations share bands."

Now let's look at the bottom line. Here are the frequencies you will
lose in
any future scanner you will buy if this bill becomes law.

Commercial Mobile Radio Services

1) Private Paging Services

Private carrier paging system (PCPS): 929-930/931-932 MHz

2) Business Radio Services

VHF low band: 30.76-31.24 (9 discrete

freqs)/33.14-33.16/33.40/35.02-35.14/35.18/

35.7-35.72/35.88-35.98/42.96-43.00 MHz

VHF Hi-band: 151.625-151.955/154.570-154.600 MHz

UHF band: 457.525-457.600/460.650-462.1875/465.650-467.1875/

462.750-462.925/467.750-467.925/463.200-465.000/468.200-470.000 MHz

There are also a number of chunks of the 470-512 MHz that will be removed.

3) Specialized Mobile Radio (SMR) Services

851-866 (806-821 MHz)/ 935-940 (896-901 MHz)

This is the only area I see where we can fight this law. Those of you who

have trunk trackers look in your trunk freq book and see how many public

safety agencies have been allowed to invade this portion of the spectrum.

There just wasn't enough room from them in the 866-869 MHz portion of this

band. I see this as the only area we can really fight this resolution, the

publics right to hear public safety agencies (even though the SMR bands are

private thanks to the FCC auctions of the spectrum). The other scary part of

this legislation is that no decoders would be allowed that would decode

digital commercial mobile radio services. Can you say digital Motorola trunk

systems? Wonder how much they donated to the Markey campaign? As I have said

on many occasions and in the April 97 MT article on all this, "follow the

money trail." No wonder Mot didn't care about the 235. It was only a flash

in their pans with this legislation.

4) Land Mobile Services in the 220-222 MHz region (recent reg changes have

turned this over to the CMRS)

5) Public Mobile Services

A) Paging and Radiotelephone Services

35.2-35.66/43.2-43.66 MHz/152.030-152.240/152.480-152.840 MHz

154.625/157.740-158.100/158.460-159.700 MHz

B) Cellular Radiotelephone Service

869-894 MHz (824-849 MHz mobiles)

C) 454 MHz Air-Ground Radiotelephone Service

454-455 MHz (459-460 MHz mobiles)

D) 800 MHz Air-Ground Radiotelephone Service

894-896 MHz (849-851 MHz mobiles)

6) Offshore Radiotelephone Services

157.200-157.400/161.800-162.000 MHz/AMTS 216-220 MHz

7) Satellite Mobile Services

137-138 MHz NVNG (148-150.050 uplinks)/399.9-400.050

1525-1559/1610-1660.5 MHz

8) Personal Communication Services (PCS)

901-902/930-931/940-941/1850-1990 MHz

So there you have it. The above listed frequencies would have to be removed

from new scanners being made prior to the type acceptance of any new

scanner. Existing models would have to be decertified then recertified to

prove that the new illegal to listen to ranges couldn't be received (the

AR-8000 syndrome). This is the situation we have today with the cellular

bands and it would now be expanded to the commercial mobile radio service if

HR 1964 is passed.

Ladies and Gentlemen I think you can see this is a serious threat. If you

don't get involved this time in stopping this legislation, you will see the

hobby of scanning listening cease to exist in the very near future. Get off

your rears and write your elected representative right now. This potential

new law is in the House Commerce Committee right now. Let's kill it before

it gets to the floor of the House and it becomes law.

Please give this message the widest possible circulation. Only numbers of

voters will overcome the millions that our elected officials have taken in

campaign contributions and will get this insanity stopped.

I will have updates as they become available and keep a watch at

www.grove.net and the scanner discussion forums as new info is available.

73 to all and let's start writing/faxing today,

Larry Van Horn, N5FPW

The TM-V7A has some very nice features. It is easy to use with the guide and menu functions. The visual scan feature is like a mini spectrum analyzer allowing you to view band activity above and below center frequency. You have PL tone scan, encode and decode built-in, duplexer built-in. The auto simplex checker is great while mobiling. You don't have to reach down and check the REV for the input signal, Auto Simplex Checker does it for you.

Kenwood has designed the heavy duty chassis heatsink with fan cooling in the rear. A real improvement over previous models. I believe that this will add longer key down times and protection for the finals.

For the packet and APRS users, you can operate both voice and data modes at the same time with the additional data connector.

Alpha numeric ID for both memory and DTMF autodial. There are 280 memories available (alpha-numeric mode 180 mem.).

The blue display is nice and Kenwood has improved the display for better visibility in daylight. I remoted my control head in the car and use it in the cross-band repeat mode and wireless remote control from the HT.

I too am considering one of these radios, but actually I think I've already decided on the Kenwood. I don't like how the Yaesu tunes all the way to 1.3 GHz. To tune that broad, the Yaesu would have a much wider front end filtering (more shitty), making it more prone to overload. I also like how the Kenwood has the built in tone decoder.

1. Add more coax to the antenna. You need to be well away from the antenna when making measurements.
2. If there is a strong AM broadcast stattion in your area, it can spoof the MFJ: been there!
3. Best is to put it on the air and measure SWR using SWR meter; resuults may be much different; I've found this to be particularly true with GAPs
4. Try mounting the antenna lower -- 8 ft off the ground is good.

Had a Titan DX abt 18 months ago. Worked well on some bands, not well on others. Sold it and put up a DX-77, which worked fine the first time.

Hi Dave,

I do exactly this all the time. The antenna is indeed the Arrow. You can get it directly from Arrow or from Antenas West or from AES. If you are going to Ft. Tuthill I will bring you one there. I will be doing demos of working AO-27 with an HT outside of the the main show barn near the AMSAT exhibit. For travel I use a 39" fly rod cas buy Boulder Landing. The entire station fits into case HT and all. During a recent mini dxpedition to Alaska I made hundreds of contacts from some really strange places. Drop me a note if you need more info.

Well, from a feature standpoint, aside from some new bells and whistles, the FT-530 kicks its ass, quite frankly. The FT-50 has some good points, but it still is not really even in the same class as the FT-530.

Sorry Marco,

It is a commercial product and not available on the net. The publisher is located about 2 KM from my house if you like I could inquire about shipment to Brazil for you. They sell it for $39 USD and include a level converter and versions for both Win95 and DOS they don't seem to be able to make the Win3 version work anymore.

Jerry

1817. Reports on FT-8000R

G'day,

I am considering the purchase of a Yaesu FT-8000R 2/70 dual band mobile rig. I was wondering if anyone has any comments, good or bad about this particular model.

Any information would be greatfully received.

Regards Andrew Laity VK3AHD

1819. Mod for W32A

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-20 00:00:00 UTC
From: jones1 <jones1@alltel.net>
Message-ID: <33D21612.864517BF@alltel.net>
Source record: 169793

The mod for out of band transmiting is as followes. Remove the four screws on the back of the radio and the two screws under where the battery is. Lift off front of radio(keypad). This is the logic unit. The is a chip diode at the back of the logic unit. The number is D523 Remove that diode and it will allow transmit out of band on both 2 meters and 440.

I use a transverter for 6 meters...a Ten Tec kit I built last year.
Works very well. "Hot receive" for DX may not be a concern w/in the
next few years as the sun-spot cycle progresses....unless you are into
weak-signal work, etc.

My advice...for a 'taste' of 6-meters, start with a transverter. If you
like...THEN start looking for a 6-meter all-mode.

ZaaX:

Help me out here. Where is there a codified right under law for the public
to hear public safety agencies? I am unaware of this right in the
Constitution or any state laws. I'm not saying that it doesn't exist but
I want to know where it is.

Next why do you feel it is important to be able to hear public safety
broadcast? Information that is necessary for the safety of the public is
given out through the news media.

As a member of a public safety agency, the only thing that I have observed
the public to do with the information it gathers from listening in, is
abuse the information gained. They rush to dangerous incidents
and add to the general confusion. The press arrives at the worst moments
and interfers with operational personnel. I've even had radio "enthusiast"
ask me for the NARCOTICS channels so they can listen in. I
just love going to funerals and seeing wives and kids crying so you can
bet I give that information out.

Public Safety agencies don't want you listening in because you don't need
to know or have a right to hear information that is confidential under the
law. I also know you will find this hard to believe but criminal misuse of
public safety information is rampant.

At least three times a year we have some enterprising ham, with illegally
modified 2 meter equipment jump on our channel and tell us all about his
IQ, what he thinks about the police, and gives us lurid

details of his sex life.

Sorry ZaaX, but I'm all for any ban that will keep the public out of public safety frequencies.

73

Patrick

So now we should not be able to listen to the RADIO now because all radio users misuse the info right?? Sounds a lot like living in Nazi Germany or Iran to me. If I had to depend on the local news media for my info I would be very uninformed. Maybe we should have banned listening to the BBC during the Gulf War because they had a different story than the U.S. media. Where do you get off saying I don't have the right to listen to any frequency? The Comm Act of 1934 does not prohibit listening to anything as long as you
do not repeat anything.

What? Lift out the keypad? I removed 6 screws from the crome RF
shield and removed it. (at the battery compartment) Then you remove D523.
This is a tri-lead SMD diode. To open up the receive there is no hardware
mod needed, just power off the radio. Press & hold the squelch button
(above the PTT) while pressing the "Band/CHNG" button, then power up. You
should see all display icons activate at the same time, then release all
buttons. Go to your "VFO" modes and step through with the "BAND/CHNG"
button. You should see quite a change.

Enjoy!

Hello John:

I used to have the same configuration you are planning to have. Now changed the radio. Just follow the instructions and all should work well. Make sure you connect the ALC line so that you do not overdrive and perhaps send out spurs.

What I did was I made a breakout box for the accessories connector on the back of my radio. A shielded aluminum box and a bunch of RCA jacks have worked well for me. This allows me to make changes fast without opening up the Accessory jack all the time. BTW the wiring is the same for all newer kenwoods hence once wired it is just plug and play!. In fact I did not change anything when I upgraded from a 820 to the 850...and now to the 870 <smile>!

I think though you will not be able to use the internal PIN diode switching if you decide to use the amp. Go into the setup menu and chooose the external relay. You will have to put up with a minor click. The Dentron relay is noisy though!

I did change the fan in the amp...with a radio shack fan - moves much more air! It is more cooler now and the fan noise is gone. The tubes are pricy though (about 75 bucks ea for a matched set of four). Get legal limit! High 300s is reasonable IMHO!

Good Luck - Let me know if you need the 10 M mod etc....got all the docs!

>ERP. Have I misunderstood something?
>73
>Bob

No, I just mistyped it. Also, my figures for forward gain in dB is an
aproximate extrapolation from the specs for a 2 element quad, which has
about the same gain as a 3 element yagi.

You have to realize that raw data on quad antennas is relaticely
non-existant for quads over 4 elements. Nobody else to my knowledge has
ever recorded any such data for a common quad over 4 elements, much less
for one that is log-spaced and has an aluminum boom. I believe mine is
unique in it's particular design and combination of materials.

What I can tell you for sure is that with 6 watts output from the rig, I
was able to register a solid reading of 10 dB over S9 in San Diego from

Inglewood, CA which is about 120 Miles from me. My quad is about 40' above the ground. My Ringo Ranger is 50' above the ground and is not at all heard by the same station in San Diego with his squelch open, nor does it even move his S-meter. Perhaps that will give people a more tangible idea of the gain. Of course, results do depend upon terrain too. There are some hindering conditions I must overcome for that contact including a range of palisades and a small mountain range. That's why they call this the Los Angels basin, because we're surrounded by crests on all sides, except for a fraction of our shoreline, but even half of our shoreline also has very high ridges seperating the city from the beach.

Yes 13 dB would be right for a yagi the same size, but this is a quad and quads generally have about 1/3 ro 1/2 more gain than a yagi when the quad's elements are the traditional even-spacing. using log-spacing opimizes the gain. I guestimate my forward gain is likey 18 dB, but I thought I'd better give a margin for error which is why I stated the above range in my first post.

I don't know which newsgroup you read this in but after this I won't be posting to *.misc after this because it generated an annoying automatic message which I did not want or solicit. I hope it doesn't put me on any mailing list or I'll be having a fit with a certain someone's ISP admin. But if it didn't then I'll just ignore it and drop the newsgroup.

I hate to go through life always feeling like a victum, but you'd think
after 50 years or so I would be used to it (-:

Here's the problem. I purchased a Standard 508 ht at Dayton this
year. The wide-band transmit mod was done on it, and it
seems to work fine, but being the HAM type of individual I am, I thought
it would also be nice to have the 800 mhz recieve as
well.
After opening the rig up (I hate to think of anything as a rig thats
smaller than a mic!) I find that a component has already
been removed that's in about the correct spot to be the wide recieve
mod, but isn't! They popped off the wrong device!
Question is, what's missing, and what's it do? The radio like I said
seems to operate correctly without it, but I'm not sure it's
performance isn't suffering in some way. Here is the drawing:

I have a ham friend who purchased the following in March 1996 and now
wants to sell as a package. IE, no piece meal.

Tri-Band Yagi (10-15-20M) 3 el., 12' Hygain TH3JRS $289.95
Balun 80-10m Hygain BN-86 $ 36.95
Mast 9' Steel Glen Martin M-1049 $ 58.95
Thrust Bearing Glen Martin TB-25 $ 89.95
Tower 8' Roof (good for 8 Sq. Ft of ant)Glen Martin RT-832 $229.95
Rotator (10SF) Yaesu G-450XL $239.95
Coax 100' RG-8 foam Belden 8214 $ 54.95
Rotator Cable 8 cond. Belden 8448 $ 24.95

____
Cost when bought new = $1,025.60

Wants $700 for the lot. Will give $100 discount if the buyer will help
take it down.

1839. Lets Reduce "For-Sale" Messages in Rec.Radio.Amateur.Equipment

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-20 00:00:00 UTC
From: kn4aq.gary@mms.net
Message-ID: <340c60c2.17736779@NEWS1.MMS.NET>
Source record: 169813

Hi, Everybody

This is another attempt to reduce the number of "for-sale" messages posted in this newsgroup (rec.radio.amateur.equipment). Traditionally, "rec...equipment" has been for equipment discussion.

There is another, better newsgroup for all the "for-sales" and "wanted-to-buys":

rec.radio.swap

Why the fuss? Well, it's just a lot easier to scan subject lines for discussion topics when you don't have to skip a lot of "for-sales." And, since there is a good newsgroup for the "for-sales," it's just easy to keep them separate.

A FEW WORDS ABOUT REC.RADIO.SWAP:

Rec.radio.swap is an amateur newsgroup, even though the word "amateur" doesn't appear in the title. And it's a good newsgroup. It's postings are more amateur radio oriented than the average hamfest! There is very little CB equipment posted, a bit more SWL/scanner type stuff, and perhaps a little too much commercial FM gear (but it is being sold to hams). Mostly it's just hams selling their ham rigs.

SOME OF THE REPLIES I'VE RECEIVED:

I've sent private mail to almost everyone who's posted a "for-sale" in rec...equipment over the past couple months, directing them to rec.radio.swap. I've gotten a lot of replies. Yes, there have been a handful of flames, and a larger group of people with well reasoned arguements. But the overwhelming bulk of replies said something like:

"I agree. Rec...equipment would be better off without
all the "for-sales." I just saw so many of them that I
thought this was the place to put them. I won't do it
again."

WHAT'S IN IT FOR YOU?

If you've got some ham equipment to sell, you want to advertise it as widely as possible to your "target" audience, right? So why not put it in rec...equipment, as well as rec.radio.swap?

Because your personal advantage comes at the cost of diluting the rec...equipment newsgroup for everyone else. Yes, you may lose the chance to have someone see your equipment notice. But you and everyone else will gain a discussion newsgroup that's easier to use, so when you do have a

question about some quirk or bug in your rig, you have a better chance of getting an answer.

ARE THERE ANY OTHER SWAP NEWSGROUPS?

Some of the people who replied said their servers show newsgroups like:

rec.radio.amateur.swap
rec.radio.amateur.marketplace

Best I can tell, these are not widely distributed newsgroups, if they exist at all. The only widely available newsgroup for buying and selling is rec.radio.swap.

CAN IT BE DONE?

Can "rec.radio.amateur.equipment" really be free of most "for-sales?"

Maybe. I'll try this for a while and see what happens (sending private mail to each "for-sale" poster, and an occasional public message).

AM I THE COPS?

No. I have no official connection to the newsgroup, usenet or the internet. This is just an appeal to reason, and perhaps a bit of peer pressure.

73,
Gary KN4AQ

Because "that kind of information" can not be obtained from any of the above about THIS antenna design. Pay better attention before passing judgement.

There is no published info on QUAD antennas over 4 elements. I know because I searched both the net, ham retailers AND a bunch of well stocked ham sections at libraries.

This is is not some yagi found in any VHF antenna book. This is MY OWN ORIGINAL design.

> Jonathon, that was a nice try, but the internet was originated as
> a medium of exchanging information, not as another commercial
> medium. Maybe another product (porn seems to well on the 'net) or
> another medium? Some adds in the ham magazines carry ads for
> products at outrageous prices and they reappear month after month
> so they must be making some money.

You were already sounding like some snobbish ninny with his head stuck up his rectum when you made the false judgement about me in the forer paragraph. But your latter paragraph is what really enforced it.

I'd bet you also belong to an all-white country club,(that intends to remain all-white), and/or are a member of a Satanic... oops... I mean Masonic Lodge,(Satanic/Masonic...same difference), and were in some snobbish, exclusive fraternity in some ivy-league university, which one could only join if you raised to believe that your so good your dung doesn't stink. You sound like JUST that type! One of the rich white democrat "Omega House" elite types like the "Greg" character in the movie "Animal House".

GIVE ME A BREAK! I've got news for you, I might not be rich, white, high-class, drive a status symbol or look down my nose at anyone who isn't stamped from the same cookie-cutter, but that doesn't make me dishonest pal and it doesn't make you any better than me. Why don't you get off your high horse, go find a good baptist church and let them teach you something about HUMANITY and about being a member of it!

Don't bother sending me any more email again until you come down to
Earth, Mr. Demigod. Because if there's one thing I can't stand, it's a
prejudgemental liberal snob!

In other words... go blow it out your ear!

Sincerely,

Jonathan DeFabritis

IMHO, if it doesn't work as advertised, it a warranty repair item.

If the book says it does this and it doesn't, it isn't right. And it is
a warranty repair item.....

At least you should "go on record" as having problems so you have a
better position when it craps out just out of warranty.....

I have my doubts about the Kenwood being all that much worse than the Yaesu,
if any worse at all. One reason is because of what you said about an IF intermod
protection for the Yaesu makes no sense at all. Most if not all intermod distortion comes from too much unwanted energy mixing in the first RF amp and/or first mixer, BEFORE the IF stage. It sounds like a bunch of marketing hype to me! Also, the Yaesu tunes as high as 1.3 GHz, so unless they use an expensive tracking front end filter, which I bet they don't, the Yaesu would be more prone to front end overload (more intermodulation distortion) UNLESS they don't have as sensitive a receiver.

The correct way to make the comparison is to test both radios in a lab with a 3 generator setup. I'm not convinced the Yaesu is better until I get one in the lab and test it.

Go with 40 meters. 15 meters is open more often than people realize, but
they just don't go there, because they "know" the band conditions aren't
right at this point in the sunspot cycle. I wish it were otherwise and
that more hams were willing to experiment and try the band out--I am trying
to finish my 5-band WAS and all the remaining contacts needed are on 15 and
10.

The novice band in 40 will often be open both day and night, although at
night you will have to work around broadcast stations (it can be done).
Also, when you upgrade, you will be able to work a lot of DX in the lower
part of the band.

You are really making things hard on yourself by starting out with a QRP
rig: I think you ought to reexamine the hardware decision.

ICOM could not receive a FCC Part 15 Type Approval if the radio could
pick up cellular. I am sure what your are receiving is an image
response, not a direct pickup. Images are part of radio and very
difficult to prevent in a high RF environment.

Starting with QRP can be tough but it can be done. My first rig as a
Novice was a Heath HW-8 I built from the kit. My first antenna was an
indoor dipole in the attic cut from tv ladder line to 40 and 15 meters.
Boy were those first contacts tough to come by with that set up! It
felt like I called CQ a million times before someone finally heard my
weak signal. About three months later, I put up a yagi for 15 meters
and the whole scenario changed dramatically. But for the first rig, I'd
probably go for more power too.

Actually, it's an ADI Radio.....same one.

According to the local Rat Shack manager...they pulled the radios
because of a modification (key code) that opens the radio up to transmit
unrestricted on all frequencies. RS didn't want to mess with this so
pulled the radio. He assures me they will be introducing a new
dual-bander in the very near future that cannot be 'opened-up'.

Any crystal supplier will require radio manufacturer and model number;
crystals are -->not<-- interchangable.

It's been twenty years since the last (amateur radio) crystal radio was
manufactured - that's why you don't find crystals at your local ham
dealer.

One source of good inexpensive crystals is:

1883. Looking for opinions of low-cost HF equipment

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-21 00:00:00 UTC
From: David Douthitt <ddouthitt@cuna.com>
Message-ID: <33D40C95.37BB@cuna.com>
Source record: 169694

I'm investigating the less-than-$500 (or so) used market for HF gear
and have found some that people seem to like; however, I do
have questions on how people feel about some rigs. Let fire
with your opinions!

Specifically:

Icom 725
Icom 735
Icom 745

Yaesu FT-501
Yaesu FT-301D
Yaesu FT-747GX
Yaesu FT-757GX II
Yaesu FT-901D

Kenwood TS-130SE
Kenwood TS-530/530S
Kenwood TS-830S

In particular, if you can make comparisons that would be
most helpful. In scanning the newsgroup (via http://www.dejanews.com)
I found that the Icom 735 is the one folks talk up the most.
A friend of mine has one, and will be checking it out - am leaning
towards the 735.

What do others think? I'm staying AWAY from QRP and AWAY from
manual tuning (if I can manage it..). Seems like the
TS-520 series is for sale everywhere but I'm going to stay
away from it. May I say - if it's so great how come everyone
wants to sell it? :-)

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-21 00:00:00 UTC
From: John J <wd2gwb@webspan.net>
Message-ID: <33D3F331.FBE38646@webspan.net>
Source record: 169698

Hello All,

I picked up a General Electric 2 piece Mobile Radio Business Radio at a
hamfest on the weekend. It has crystals for 6 Meters in it. and I am
told its power out is abt 55 Watts.
Looks like a radio from the 70's or 80's
It is Possibly a MASTR PRO model
I Cant find any model number on it though
.
It has a 3 Wire Power Cord almost like a 3 Wire AC cord.
All wires the same color Black, with Lugs on the end/
I found the Chassis Ground but I need to know which of the other 2 wires

is for for power and what the other wire is for. Perhaps it is a
floating ground?

If anyone has any data on this unit or
if anyone out here can Email me a pin out or post the pin out for it, I

would appreciate it.
Thank you in advance.

73,

John WB2GWB

You know, for $50 more you could buy a ft-50 and receive the same stuff
and have ctcss enc/dec every where. I am able to enc./dec. in the 220
band.

Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.swap

Hello,
Need more power on 440? I have a deal for you. I have 2 NEW homemade six-element 440 YAGI antennas. Made of sturdy 3/4" by 3/4" hardwood and laquered to resist nasty WX.

Built from a PROVEN design these cute little antennas use PART of a folded dipole for the driven elemen. Using a computer to model the loading effet of the other elements, a direct 50-ohm impedance match is achieved WITHOUT a complicated matching system.

This is a combination of simplicity and excellent performance. When pointed at a 440-Mhz repeater, this antenna is like kicking in a 25-wat amplifier.

Price is $30.00 + shipping from Montana.
e-mail if interested, or if you want more info.

Thanks,
Adam / kc7ljq

Barry:

I'm just curious why you sent your 8000 back. You got a great price and a great radio in my opinion. I just love mine. I admit that it doesn't have all the features I might like but when I weigh the price I paid against what I got I'm very satisfied.

Did you have a problem with yours or were you more interested in a higher power unit?

> to its communications has something to hide.

This is true Todd, but not in the way you believe. Law enforcement agencies must protect information that by law cannot be released. Such items as DMV, and NCIC information is privileged. We also want to restrict tactical traffic from the bad guys, so that's why we are going to encryption. I'm also leery of the seemingly innocent barking dog type of call. If the bad guy knows where I am and how long I'm there then he has carte blanche to do his will where I'm not. You wouldn't ask combat maneuver units in wartime to let the enemy listen in to their plans would you?

Already MDTs keep much of
> the communications from the general public. Press agencies are able to
> monitor but not John Q. Public.

This is interesting. I had no idea that the media had the technology to intercept MDT traffic. I haven't seen this in California. Would you be kind enough to forward more information on this subject to me or post it here, whichever you prefer.

Well I sure am glad that the media is
> there to decide what information about my community is important enough

Don't get me started on the press. I have little love for them either. I don't mind them printing information but the little snots never get it right.

Last but not least this whole swing to MDT, digital, and encryption actually had nothing to do with security when it first arrived. The channels were getting too crowded and we had to come up with ways of cutting down on back and forth chatter.

>
> ...and of you don't want me picking up your radio waves with my scanner,
> then keep them out of my body.

Bill:

Unfortunately Zack censored my reply to him to fit his own needs. I asked a simple question and told him why we in law enforcement don't want people to have the ability to monitor our traffic. He stated that there was a right to listen to specific radio frequencies and I question that belief.

I also understand that the Constitution doesn't cover all rights in this country, but it is questionable, if it is not specifically mentioned in the Constitution, if a particular activity is a right. There are those who believe that the operation of a motor vehicle is a right, but in fact it is a privilage. I believe that listening to police information is a privilage and not a right. If airways were not subject to governmental control then I wouldn't need a license to operate on the ham bands.

As another poster points out this will all be a moot point soon. Encryption will kill scanning.

I own 3 units. One for me and the other 2 are for my sons, both hams.

So far (only a few months) the units have held up very well.

GOOD POINTS:

+ Reasonable cost, $120 (USA) from HRO.

+ Small size AND light weight

+ Uses standard AA batteries

+ I can work a repeater over 20 miles away, with some noise, but it's clear enough to understand. Not bad for 1/3 of a watt!

+ The "flip up" antenna is quick and easy to use.

BAD POINTS:

- In the city, intermod noise appears every now and then. However, outside the city, intermod noise isn't a problem.

- Your power is limited to 1/3 of a watt.

- There's no way to attach an externial antenna.

Overall, I'm very happy with my units.

Message-ID: <33D45314.1197@pacbell.net>
Source record: 169712
Cross-posted to:
sci.engr,sci.engr.electrical.compliance,alt.engineering.electrical,rec.radio.amateur.equipment,sci.electronics.equipment

To: All
Subject: Need sanity check for one point of antenna theory

Here goes:

The gain of any antenna is referenced to a theoretical isotropic radiator. A half wave resonant dipole (in free space) has a gain of 2.15 dB over an isotropic source; hence it's rated at 2.15 dBi.

A quarter wave, end fed, monopole rod, erected normal to an infinite ground plane, displays a field pattern equal to one lobe, or one half, of the pattern formed by the dipole antenna. The ground plane serves as an image, or mirror, of the other half of this resonant system.

So, the monopole directs the radiant energy into only one hemisphere (above the ground plane), at the expense of no radiation into the other hemisphere (below the ground plane). From the vantage point of those observers located above the ground plane, the monopole creates a field with twice the power of a dipole.

And, since twice the power is a 3 dB increase, then the gain of a quarter wave ground plane rod is 3 dBd, or 5.14 dBi.

Uhhhh, right?

As I understand it, the radio was deemed by RS as too easily modified,
so they pulled it. Many who want a similar radio, with even more
features at a very good price, are getting the ADI AT-600. I did, and
so far I am pleased with it.

Message-ID: <gLg+jFANtp0zEwh4@firstchoice.demon.co.uk>
Source record: 169743

Hello.

This is the situation.

I am currently looking for a used HF rig, with the option of getting on 2meteres, and even possibly 70cms. It must be all mode, and preferably a mobile rig. I may accept a hopmebase rig, if it is much cheaper.

I know there are lots of new rigs on the market like the Icom 706MKII, but they are out of my price range.

Basically, I want an all mode rig that transmits and recvs. on 0.3 (or close) - 30mhz, with definitely 2metres, and possibly 70cms.

I will be mainly using this rig mobile.

Can anyone advise me on what rigs are good, I have seen the FT-757 nd FT-767, and I am sure you can get them to work 2metres aswell.

What is a good rig that can be modded to transmit on 0-30mhz, be able to get on 2meters, and possible 70cms too.

Thanks in advance of your reply!

Hello From Canada's Ocean Playground Halifax, Nova Scotia, Canada!!!

We are looking at starting up a TRUE community FM radio station. A station that hears what the listeners are asking and seeking. The station will not focus on one format, BUT will be a VARIETY station.

We are running on a shoe string budget right now, and need the help from ANY radio lover out there!!

If you have any USED radio station equipment that you wish to donate, then please help us!!
From reel to reels to ON-Air Signs, whatever you can spare!! We have about 80% of the items already, BUT as you know MORE is always needed!!
Also, any music you may be able to donate (60's, 70's, 80's 90's) from ANY music format would be GREAT!!
Please e-mail me <harrett@istar.ca>, or if you want to send items, from the USA please mark "GIFT" on the package if it's coming from your home, as it will save $$$$ at customs. There's no need to label "gift" on it from a business.

The snail address is:

WAYNE HARRETT
18 JUNIPER CRESENT
EASTERN PASSAGE
NOVA SCOTIA
B3G 1E1
CANADA

We THANK YOU for any effort you can help us out with this project!!!!

1914. News Rover -- Searches newsgroups for what you want - 218 0721023622 HVK

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-21 00:00:00 UTC
From: 693@RoverBase.com
Message-ID: <5qv3dc$b2d@news.triton.net>
Source record: 169752

Automate your collecting research!

News Rover is the ideal tool for searching through Usenet newsgroups for messages about items that you collect. Once you tell it what to look for, News Rover will scan a set of newsgroups and collect all messages that contain what you are searching for. For example, if you are interested in messages related to slide rules or calculators, you could specify a search expression such as:

slide rule or calculator

News Rover will then scan a set of newsgroups you select and collect any messages that match the search expression. This searching is completely automatic, so it works while you sleep, work, or play. The search expressions can be as simple as a single word, or they can be complex expressions with AND, OR, NEAR, and NOT operators.

You can download a free demonstration copy of News Rover from:

http://www.NewsRover.com

But News Rover is good for more than just searching collectables newsgroups. You can use it to search for family names in genealogy newsgroups, or for any other type of information in any newsgroups you choose. And News Rover is ideal for picture newsgroups. It decodes both UUencoded and MIME base64 images, and it combines and reconstructs binary files that are split into multiple messages.

Here are some of the key features of News Rover:

o Scans newsgroups you specify while you sleep, work, and play.

o Automatically downloads messages and attached files so that they are available for instant access when you are ready to review them.

o Decodes attached files of all types (UUencoded and MIME base64).

o Displays a picture gallery of collected thumbnail size images.

o Selects messages based on include and/or exclude criteria to help you find a needle in a haystack and eliminate spam. You can even use complex selection expressions with AND, OR, NEAR and NOT.

o Supports multiple "interest groups," each with sets of newsgroups, selection expressions, message database, and picture gallery.

o Remembers files already extracted and eliminates duplicates automatically.

o Saves parts of multi-part files, searches for the missing parts, and rebuilds the entire file when the last part arrives. It even combines parts found on different days and in different newsgroups.

o Allows you to post Usenet messages and send e-mail messages.

o Operates on a schedule you set up to use your phone line only when you don't need it.

o Automatically dials the provider and hangs up the phone when it is finished.

o Works with almost all Internet providers and news servers.

o News Rover is multi-threaded so you can read messages and view pictures while it downloads and decodes more messages.

News Rover was designed and written by real-life Usnet newsgroup junkies! With News Rover the news is ready when you are!

To learn more and download your free demonstration copy, visit:

http://www.NewsRover.com

News Rover is getting rave reviews...

D.G. says: I downloaded News Rover last night... I ordered this morning. I don't know how much time I saved. I give your product two thumbs up!!!

T.B. says: "Great Job!!! I tried your software for the first time today, and it beats Plukit-32 hands down!!

Good advice. On the other hand, everybody has to buy at least one MFJ
product at some point - it's part of the learning process. Some of us even
had to buy two or more MFJ products before we got the message - we're called
slow learners. ;-)

Can you provide the details of this "extrapolation"? Differences
in gain between short yagis and short quads disappear quickly as
the boom length approaches multiple wavelengths.

> You have to realize that raw data on quad antennas is relaticely
> non-existant for quads over 4 elements. Nobody else to my knowledge
> has ever recorded any such data for a common quad over 4 elements, much
> less for one that is log-spaced and has an aluminum boom. I believe mine is

Huh? Any decent modeling program based upon any of the NEC models
can tell you what the gain will be. Having done extensive modeling
of yagis, quagis, and quads at VHF/UHF, I can tell you that there
is little in appreciable gain to be had in quads over yagis when you
hit 3+ wavelengths.

> What I can tell you for sure is that with 6 watts output from the rig,

Anecdotal evidence is just that. I've worked Oklahoma from Illinois
on 6 meters loading up my 2 meter ringo ranger. That certainly
isn't an endorsement for a 2 meter ringo on 6.

> Yes 13 dB would be right for a yagi the same size, but this is a quad

This is only true for very short quads. At multiple wavelengths, the
differences are negligible.

> using log-spacing
> opimizes the gain. I guestimate my forward gain is likey 18 dB, but I
> thought I'd better give a margin for error which is why I stated the
> above range in my first post.

Guestimate? Have you modeled your antenna with any reasonable
modeling program? The NEC based programs are fairly accurate and
would likely show you that any such differences in a quad versus
yagi are negligible.

> I don't know which newsgroup you read this in but after this I won't

For Sale: Drake L-7

I have a like new Drake L-7 Amp and Power Supply.
160 through 10 Meters. No scratches, Non Smoker.
Have Shipping Boxes and Manual, runs 3-500Z tubes
with 1400 to 1500 watts out on all bands, with
100 watts drive.

$900.00 PLUS SHIPPING

Or would trade for a CLEAN KWM-2A Round with PS
Must be exc. cond.

Thanks,
Boyd N6DMF

> Terry (KA5IHV)

Dear Terry,
Why would you want to confine yourself to only one band? Is it money, complexity, antenna restrictions? It used to be that a transmitter to cover several bands was tough - nowadays any rig that doesn't cover all HF bands isn't worth buying. An all-band antenna is inherent in any antenna that can work out on 80 Meters - IF YOU USE LADDER LINE to feed it and you have a good tuner. Two years from now you will believe this.
Any questions?

After reviewing the responses to your post -- how about
trying THIS:

Submit the plans as an article to QST. You can get paid
as much as $60 a page!! And they will even let you
advertise your plans in the article.

Is this a great country, or what?

Contact AA2LN via e-mail at aa2ln@juno.com and tell him you would like a
copy of the plans for the so-called "half square" antenna. Lots of
people have used it and swear by it. Basically, its a feed point as
high as you can get it with a 1/2 wave hanging straight down from it,
and another 1/4 wave going straight out horizonal and from the end of
that a 1/4 wave hanging straight down again. Sounds worse than it is.
Said to have good directivity and low angle of radiation.
73 & good luck
Bob

1945. ICOM IC-T2A programming

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-21 00:00:00 UTC
From: gastineau@mindspring.com
Message-ID: <33d4bcc1.5345166@news.mindspring.com>
Source record: 169783

I have two new ICOM IC-T2A 2m radios. The windows programming software is mighty convenient, but there's one obvious error that has me wondering if there are other known problems with it.

In particular, the toggle between frequency and channel number display is reversed. If I choose frequency display, the radio wakes up in channel mode, and vice versa. Not a big deal, but sloppy.

The display in the channel memory screen doesn't quite match the help file in that the tone encode/decode settings are not shown in the way the help implies.

So, has anyone else encountered problem with the windows programming software for the T2A?

I'm using version 1.02.

Thanks,

JEG

> I want to know where it is.

The Communications Act of 1939 specifically stated that you could receive anything you could contrive to receive. There were some limitations on disclosure, but the law said you could receive anything. This is why states that ban radar detectors had to ban possession of the device itself, not its use; use was protected under Federal Law. Now, the new Communications Act of 1996 has changed a lot of things, and I'm not sure where we stand.

In any case, the whole question is moot. All such communications will soon be digitized, trunked, and encrypted. It will be all but impossible to listen in.

1948. FORSALE - Immaculate Kenwood TS-520, great starter rig

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-21 00:00:00 UTC
From: jpl@qc10.ho.lucent.com
Message-ID: <5r0avu$3h2@nntpa.cb.lucent.com>
Source record: 169786
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment,nj.forsale

I have a virtually immaculate Kenwoods TS-520 rig that I would like to sell.
This was my first "real radio and in my opintion is still
one of the best rigs around. It would make a fantastic beginner
station or a great backup rig.

I am only the second owner of the rig.
I purchased it from a collegue of mine at Bell Labs (who
was the original owner), and I have the orignal sales receipt,
boxes, and manual for it. Both he and I took
exceptionally good care of this rig. It has NEVER been in a smoking
environment and has NEVER been mobiled.

For any novices not familiar with this radio, it is all solid state
(discrete components, so its very easy to repair if ever needed)
except for a tube driver and a pair of very
robust 6146 tubes as the finals. It has a builit in power supply,
but can also run off of 12VDC.
It covers 80,40,20,15, and 10 meters in CW and SSB (upper and lower) modes.
The receiver section is excellent and I always get excellent audio quality
reports. Many folks say that these older Kenwoods are some of the best
sounding rigs on the air.

This rig also has the optional 500Hz CW filter
installed (genuine Kenwood option).

The price is $300 firm + shipping. You might find one for a few $ less,
but NOT is this great condition. Also have a DG-5 digital display which
I will sell with the rig only for an additional $75.

1950. FORSALE - Kenwood TS-520S + VFO-520S Mint, great starter rig

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-21 00:00:00 UTC
From: jpl@qc10.ho.lucent.com
Message-ID: <5r0b24$3h6@nntpa.cb.lucent.com>
Source record: 169788
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment,nj.forsale

I have a mint Kenwood TS-520S plus the optional matching remote
VFO-520S that I would like to sell. In my opinion, the 520
and 520S are some of the best rigs around and would make a
fantastic beginner station or a great backup rig.
The remote VFO is a wonderful option to have and give
the capability to either run split frequencies or to flip-flop
between two frequencies.

For any novices not familiar with this radio, it is all solid state
(discrete components, so its very easy to repair if ever needed)
except for a tube driver and a pair of very
robust 6146 tubes as the finals. It has a builit in power supply,
but can also run off of 12VDC with the optional DS-1A
DC-DC convertor. It also has connections for the
Kenwood DG-5 digital display.
It covers 160,80,40,20,15, and 10 meters in CW and SSB (upper and lower) modes.
The receiver section is excellent and I always get excellent audio quality
reports. Many folks say that these older Kenwoods are some of the best
sounding rigs on the air.

This rig also has the optional 500Hz CW filter
installed (genuine Kenwood option).

The price is $400 firm + shipping. You might find one for a few $ less,
but NOT is this great condition. Also have DG-5 digital display which
I'll sell with the rig only for an additional $75.

> This is why states that ban radar detectors
> had to ban possession of the device itself, not
> its use; use was protected under Federal Law.

WARNING: SARCASM AND RANT FOLLOWS

Why then couldn't the possession of a scanner be banned? This kind of crap is infuriating. It is okay to receive the signal but you can't have a device which receives the signal? Isn't that like saying that erecting an antenna to receive television signals is protected by federal law, but the posession of an antenna capable of receiving television signals is against the law? Don't both situations preempt federal law?

I live in Virginia and I think the radar detector use law is ridiculous. It comes up for renewal every few years and for some stupid reason, it is passed time and time again. I can't put up an antenna either, even though that is protected by federal law, so why should I be surprised that I won't be able to own a scanner next?

A law enforcement agency which is worried about having the public listen to its communications has something to hide. Already MDTs keep much of the communications from the general public. Press agencies are able to monitor but not John Q. Public. Well I sure am glad that the media is there to decide what information about my community is important enough for me to know about. Oh, and they present it in such a precise and informative way as well.

My 2 cents.

This is a terrific idea. I wish I had the time to stop by my local
precinct to read the police reports. Instead, I will continue to rely on
the accurate and timely reporting of the local media.

I have built the 6 meter FM Transceiver, and had excelent results. The
manual was very well put together with explanations and very useful
information. The alignment is simple, and the equipment needed would be
found in just about every shack, no matter how small. Before buying this
kit, I looked at other kits available, and found that for the money the
Ten Tec has more features and is more complete(ie Case, mic, etc.)than
most of the other kits I looked at. Also with one little mistake that I
made in parts identification, Ten Tec help with finding the problem and
then rushed the part to me.
With this, I would not hesitate to construct any of the Ten Tec Kits or
buy any of there equipment.
I am telling you this as I feel that as hams, if we find a product or
kit that lives up to the ads, we need to let others know.

73's hope this is what you were looking for

I tested the IC-200OH against a Alinco DR-570T dual band radio. I also tried a 5/8 wave magmount and a Larson Dual band antenna. While I still get intermod on the Alinco it is not nearly as bad as the ICOM 2000H. I purchased the Icom because of its advertising about how "intermod resistent" it is. My Icom 2000H is a 2 months old. The internal/External construction of the ICOM is truly superior to most radios I have owned but I am disappointed with the Intermod. Several Hams sent me similar views and feel they were "hoodwinked" by Icom. When they complained they were told that they should expect it to get intermod since it is a wide band receiver 136 to 175 MHZ. True. but the ads should not say intermod resistent if the radio is actually worse than most other radios in its class.

4-GE MPD/MPA Public Safety Mikes

Part #198801586P2 New in box. List price is $195. Here only $50 + COD shipping or MO in advance and save the COD charge.

Have 4 pcs. all in box.

With this mike you move the antenna from the radio to the top of the speaker mike. You attach the plug to the radio and you can transmit with the radio on your belt.

1-GE MPD/MPA Surveillance mike/earphone

Surveillance mike/earphone combo like the Secret Service uses. Mike and switch clip to your shirt. GE lists for $165, here $50. New.

1-Decatur K band radar unit. VG condition. One antenna. Unit will has switch to allow it to be used in stationary mode or moving mode. Incandescent vacuum tube numbers show both your vehicle speed and vehicle being clocked. Speed alarm (you set the speed for the alarm to go off at) and speed lock. Comes with cigarette lighter plug.
$350 + Fedex COD

1-GE MPD/MPA Starndard Charger

Part #19B801506P11 Standard Charger. Excellent Condition. $25 + Fedex COD shipping from Boston.

1-GE MPS HT/64 channels. 136-151 split currently on Civil Air Patrol and
ham radio splits and simplex channels.

New Large battery and antenna. Also has leather case, "convert-a-com" with mike, and amplified speaker. Will charge unit in the car in 2 1/2 hours. Unit becomes car radio when in the "convert-a-com". Also have a six gang charger (14 hour charge) that I will include if you want it. Works great. Radio is in VG condition. 6 watts out. $250 + COD shipping.

1-Heath HW-101 Tranciever. VG condition. Comes with Heath external speaker and Heath Power supply. No Mike. Original instructions. $150

Thanks for reading this!!

Gary, thank you VERY much. Unfortunately, I took the word of someone from tech support at ICOM. He said I WOULD have to flip the switch, but he said it should be at the "other" position. It came from ICOM in the "OTHER" position.

I changed it on my mobile setup and now it works like a champ! I have just been carrying a barrel connector in my car to bypass the amp for 6 meters. Have you been doing anything different?

BTW, I had my message returned that I sent to your e-mail address. Is your address anti-spam?

Thanks!

You might do well by investigating International Radio's filters for the
Kenwood TS-940S. I have a pair of their 500 Hz CW filters, and thinking
of getting a switch kit to switch between 250 Hz and 500 Hz on CW.

Their filters have steeper skirts than the stock Kenwood filters.

Message-ID: <01bc9729$e15db780$081a98d0@default>
Source record: 169604

I bought an ADI AT-600 HP last week and I love it! I really struggled with the decision because the price seemed too low for the number of features advertised.

This is a 5 watt HT with tons of features. It pretty well matches or exceeds all the other brands for features, power and specs and for less money. We had to beg HRO to order them but we are glad they did. All my friend that I have talked with are amazed at the power, clarity and features of the radio. I think it's a keeper.

If your thinking about an HT and want a good one, give a good hard look at ADI.

~~~~~~
Yup, you are right, that is, the gain is 5.161 dB. Give me your fax
number and I will fax you a chart with the patterns and the gains for
several common spherical and hemispherical antennas. It will then make
complete sense.

From: Harvey Trautenberg <traut@bellsouth.net>
Message-ID: <33D4BAE2.C3@bellsouth.net>
Source record: 169607

I recently bought a VX-1R. It was able to receive full 800 as well as transmit in VHF and UHF with extended frequencies. I had a problem with the radio last night and was required to do a full reset. Now the radio only rx/tx on factory specs. Does anyone know how to get me back to the old specs? Please email and post. Thanks For your help.

PS The ARS for repeater shifts worked in VHF but not UHF when I had the full coverage. Very Wierd.

This is one great attribute of the Kenwood TS-4xx series radios. They have the best mobile noise blanker I have ever worked with. While the newer TS-50 has a very effective ignition noise blanker, it can't compare to my reliable TS-440.

Thanks for your intelligent post. I have purchased and installed
two new Phillips ECG352 transistors (at $46.00 each). The amplifier
now operates properly into a dummy load and after I build a decent
cover/case for it, I will put it into service.

I am now happy with my purchase, except for the fact that I had to
spend an extra $100. Sort of like buying a used car with two flat
tires....

Thanks to all who privately emailed me with suggestions and support.

This behavior is apprently due to the rapid scan rate. It takes *time* to decode a PL (because it is a low frequency and it takes time for a cycle to be received), so rapid scanning can miss the tone.

>out for when I use those adapters? THANKS!

The problem with these adaptors is that they put a great deal of strain on
the SMA to case mechanical joint on the radio. You have to handle the
radio carefully when the adaptor is in place or you can cause the SMA
connector to pull through the case. Then it is new case time. Proper
antennas for these radios include a rubber shoulder which relieves the
strain on the SMA mount, the adaptors don't have that.

Rather than using an adaptor, a better approach is to use a small coax
cable with a SMA connector on one end and a BNC or N on the other.
The flexible coax will avoid the strain on the radio's SMA connector.

explitive deleted

Wow I can see we have a real rocket scientist here! If I recall
the original post described the proper way to test RF power transistors
using the diode test function of a multimeter. A class C power amp will
have low Z coils to ground and possibly a 10 ohm or so resistor to
ground at the base that will have to be lifted. then check for a
junction (typically .55-.65 V for most npn rf power devices) using the
diode check on your meter. Since most of these devices are made of
multiple die be sure to check for reverse leakage and throw it out if
you see any.

This check will usually ensure the the amp will produce some power but we still dont know if all thoes die that make up a mulitiple die RF power transistor are good untill a gain check is made. In other words fire it up and see if you get rated power out for the given input. I not determining which transistors in a multiple transistor amp are low on gain can be trickey. Sometimes a RF probe can help as can collector current measurements. On amps with parallel outputs, short the base to ground with a small cap (low z at operating freq) and watch change in power out for each device. The bad one will usually will cause little or no drop in output.

For jamestone, The diode check function forces a constant current and measures the voltage, if your meter doesn't have this you ought to consider getting one.

Finally this poster does not know Terry Hammond and does not make any judgement on his personal character.

Hello all, You might have notice my messages from about 2 months ago selling all kinds of things. Im a disabled ham and i just got my dream station, thanks to my good friend (tony ka2ypt). I have a kenwood ts-850s/at with all the trimming's
including the station monitor. Now i would like to fins a kenwood tl/922 w/ 10 mtrs.
But i dont want one that is running. I would like one that is blown. I cant afford one in mint condition so ill take one that is blown and try to revive it. even with soft tubes is okay.. just cant pay much for it.. so if you have one that was hit by lightning please let me know..73 and thanks for reading..

>etc.) is not a problem.

Are the two questions you ask meant to be the same thing?

Receiver desensing, as I've commonly heard the term, is also known as
blocking. I take it to mean the degree to which strong in-band
signals will actually reduce the sensitivity of the receiver.

Measuring the effects of a laptop computer operating in close
proximity to 400 and 800 MHz radios is more a question of stray
radiation. Receiver performance has little to do with it. Laptop
shielding and antenna proximity has more to do with this problem.

Please elaborate...

Hello!

I have the opportunity to buy a very good condition YAESU FT-780R and I wonder if you can tell me the current market price for this rig and if I should ask for any installed options (and its value).

I would also like to get information about its performance and any other hint about it. Also, any information about mods to use it in 9600 baud packet or satellites would be welcomed.

Thanks and best regards.

> it here, whichever you prefer.

I am not knowledgeable of this subject. I have only read that there are certain jurisdictions which have moved to encrypted communications which have been required to provide the media with the ability to monitor public service communications, thus giving the 'public' access. Apparently this has included making law enforcement radios available for members of the media to monitor. I believe one jurisdiction is in Texas. There was a discussion about this topic on alt.radio.scanner or rec.radio.scanner a month or two ago.

I appreciate your opinion, but I do not believe banning scanners will have the desired effect on true criminal use of scanners. In fact, I believe there is a public benefit to having citizens able to monitor public safety communications. Also, technology exists to selectively encrypt data which is protected under law such as personal information.

BTW, do you think that criminals aren't sophisticated enough to obtain and use MDTs or law enforcement radios capable of decryption? I'm sure a petty criminal might use a Radio Shack scanner as an aid to commit a crime (though I'd be interested to know how many), but couldn't a criminal create a diversion to lure officers to another side of town and accomplish the same thing? How do you know _who_ reported the barking dog?

> I'm also leery of the seemingly innocent barking dog type
> of call. If the bad guy knows where I am and how long I'm there then he
> has carte blanche to do his will where I'm not.

This may be true in Mayberry, but not in most communities. Unless of course the entire shift shows up at the scene to muzzle the dog.

Getting scanners out of the public's hands will probably be easy from a legislative standpoint. Politicians love doing things that the public thinks are for the good of the public. The communications privacy act comes to mind. Hey, if criminals can't buy guns then they won't be able to use them to commit crimes either, right? See, it works.

I surely don't know the answer to solving the country's crime problem. I am grateful that there are people in the law enforcement community who put their lives in jeopardy for mine and my family's safety. Officers of the law are given powers by the public and paid by the public to protect the public. It is my right to know how they do that. Saying that they can't do their job with the public knowing every detail of how they do their job does not cut it with me. It is my right to know what is happening in my community.

John,

I also have an IC-T2A and the programming software. I didn't realize that toggling the frequency/channel display had the effect you described. However I did set mine for frequency display, it woke up in channel display, I turn it off and back on holding down the keys to reset to frequency mode (I don't have the keys memorized or the manual handy). I was then able to use the radio normally.

When I tried to print the memory assignments I just got a page of dashes. When I called their tech support the programmer was on vacation but the lady was very friendly and sent me a new version which would allow me to print the memory assignments and she thought it might have some other fixes. I also reported that selecting frequency display left me channel display after downloading.

A few inconveniences in the software, which the company seems to want to fix, but the software is still mucho-squared easier than programming 40 memories by hand.

Just build a cable using the parts supplied with the radio and tuner.
>
>Connect the radio to the transmitter terminal, connect an antenna to
>the ANT terminal. Make sure the antenna has less than a 3:1 SWR.
>Place the radio in FM, AM or RTTY mode and key the mic. The AT-160
>now will tune properly.
>
>*** The tuning button on the front of the IC-706 will not operate when
>using the AT-160 tuner. It was designed for use with the AT-180

Sorry this isn't correct. I have the AT-160 connected to a 706. I
constructed a cable using the supplied cable with the tuner, and the
supplied multi-pin plug with the radio. Using the wiring diagram in the 706
manual I connected the "same" functions for each of the pins. Almost all of
the colors match except one, eg, red to red, blue to blue etc. Connected
the radio to the tuner. Hooked up an antenna to the 160. Put the radio on
40 Mtr LSB and pressed tune on the radio. The 706 keyed up, the tuner
tuned, and the radio swr meter showed a 1.1 match. The only drawback is to
connect a properly matched 6 mtr antenna and use the tuner for everything
else, since the 160 won't tune 6 meters.

1998. Repeater Radio Info Needed

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-22 00:00:00 UTC
From: Randy <RWnospam45433@aol.com>
Message-ID: <01bc96bd$313e8ee0$3323f489@wrdiss1.robins.af.mil>
Source record: 169667

I am trying to get an Amateur Radio 2-Meter Repeater on the air
by using 2 commercial radios.

I recently purchased at an auction:

2 GE Mastr II radios
2 Motorola MOCOM 70 radios
2 GE (DELTA?) NA111-COMB
1 Motorola "T83RTA3203BA"

I could use any information on these: power output, frequency
range, etc, and especially on how to tune up for
a 144/145 repeater pair. ALSO, need source for repair manuals,
parts, etc.

Comments on the reliability of any of the above in a repeater
environment?

THANKS IN ADVANCE FOR YOUR HELP!!

>am not partial to any manufacturer. Thanks in advance.

Bob,

I've used an Icom 730 and a Kenwood TS-130S, and both perform quite well for the money. You should be able to snag either one for about $350 to $400 these days. I think the Kenwood's receiver and filtering were a tad better than the Icom, but not enough to really sway a purchasing decision one way or the other. As a bonus, both of these rigs also do fairly well on CW as fixed station rigs (assuming the proper CW filters are installed). I used my TS-130S with VFO-120 remote VFO as my main station rig for about 2 years back in the early 1980s and it served me quite well.

Happy shopping!

> download the info?
>
> Thanks,
> Randy KD4YKV

Hello everyone,

Here some mods i found in packetradio,
and i have try this mods and it works great.

KENWOOD TM-V7 mod.
==========

You can easily expand the frequency range of your TM-V7 to the
following:

VHF : 118-136 MHZ AM (or FM) RX only.
136-174 MHZ FM (or AM) RX and only TX in FM.
AM/FM switching automaticaly or if need manualy with holding the
MHZ
button more than 1 second (tune knob).
!!! VHF LO BAND RX: better on main VFO.
VHF HI BAND RX: better on sub VFO (UHF side).

UHF : 300-470 MHZ FM RX and FM TX only between 410-470 MHZ.
800-1000 MHZ FM RX only.
You can switch this two bands in "VFO mode" with holding the MHZ
button
more than 1 second.

Cross band repeater (menu 17).

How to do it:

-Remove the 12V power supply.
-Remove the display.
-Remove the 4 screws fixing the bottom cover (the side without speaker).
-On the "front panel print" locate a row of staps (0 ohm resistors)
numbered:
0 1 2 3 4 5 . It's there !

x - x x - - European version 144-146 and 430-440 MHZ RX-TX.

- - x x - - RX only mod like above. TX 144-146 and 430-440 MHZ.

- - x - - - RX-TX mod like above.

x : Strap jumped.
- : Strap open.

-For "cross band repeater" close 4.

-It work great but you can try other combinations.

73's and 51.

I don't believe banning scanners will do any good either, but I do
believe that encryption will be effective.

In fact, I
> believe there is a public benefit to having citizens able to monitor
> public safety communications. Also, technology exists to selectively
> encrypt data which is protected under law such as personal information.

That's correct but the problem is that this information is intermingled
with open information. How do we selectively censor this information. I
think you can see we can't.
>
> BTW, do you think that criminals aren't sophisticated enough to obtain
> and use MDTs or law enforcement radios capable of decryption?

Oh absoulutely, but that takes real work and not just going down to
Radio Shack and buying a hand held. As a matter of fact an agency here
in California busted a guy who had paid off an employee of a major MDT
and software firm for access codes and equipment.

I'm sure a
> petty criminal might use a Radio Shack scanner as an aid to commit a
> crime (though I'd be interested to know how many)

Well I'll try to give you some idea. In 25 years of law enforcement I
have confiscated exactly 21 guns from people I have arrested. When I
worked in narcotics I always found scanners during a search warrant
service. Just about every burglar I collar has a scanner. I know those
are not hard numbers but you make up your own mind.

, but couldn't a
> criminal create a diversion to lure officers to another side of town and
> accomplish the same thing? How do you know _who_ reported the barking
> dog?

Correct also but they still need the scanner to be sure I went where
they sent me and if I'm still there.

>
> > I'm also leery of the seemingly innocent barking dog type
> > of call. If the bad guy knows where I am and how long I'm there then he
> > has carte blanche to do his will where I'm not.
>
> This may be true in Mayberry, but not in most communities.

95% of all law enforcement agencies in the United States are small to
medium size departments so Mayberry is in the majority not NYC.

Unless of
> course the entire shift shows up at the scene to muzzle the dog.

It is common place for the majority of departments in the United States
to field 4 or less officers for an entire city during any one shift. The
national average for total departmental compliment of personnel is 2.5
officers per 1000 population. Since they all can't be on duty at one
time the actual on duty patrol ratio becomes 1 per 15,000 so a city of
40,000 will usually field 3 officers and 1 supervisor. Thus even though
the entire shift will not show up to the barking dog call losing 25 to
66% of you patrol force hurts allows a lot of flexibility to the
criminal.

> Getting scanners out of the public's hands will probably be easy from a
> legislative standpoint. Politicians love doing things that the public
> thinks are for the good of the public. The communications privacy act
> comes to mind. Hey, if criminals can't buy guns then they won't be able
> to use them to commit crimes either, right? See, it works.

I'm not for taking scanners out of the hands of citizens either. I'm in
favor of restricting their access to my frequencies. If they want to

know what's happening on my PD then come down and read the reports just as the press does. That in fact IS their RIGHT.
>

> happening in my community.

As I just stated above the public should read the reports if they want the details. In fact a citizen will learn more because they now have access to what the suspects are saying and not just what the police say. As a police supervisor even I can't tell exactly what the hell is going on by just listening to the radio traffic. I have to read the report and talk to the officers face to face. In fact radio traffic can be dangerous because it is replete with misinformation sputtered out by excited officers.

2007. Re: Warning: Multi-meter abuse

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-22 00:00:00 UTC
From: Jim <jstrohm@taxes.net>
Message-ID: <33D4CA19.5F42@taxes.net>
Source record: 169676
Cross-posted to: alt.radio.broadcasting,alt.radio.pirate,rec.radio.amateur.equipment,rec.radio.shortwave,rec.radio.swap

I've seen certain high-voltage semiconductors FAIL a
"diode-test" function check on a multi-meter (and I
believe my Fluke 77 qualifies as a high enough quality
meter to work properly). I've also seen, as another
poster noted, RF circuitry surrounding transistors
indicate a failed part. In all those cases, the parts were good,
and tested good under proper test circumstances -- completely
out of circuit and tested with an appropriate test set.

Seems to me -- and I am but a lowly appliance operator --
that if a modular component were sold as "Tested/Known Good,"
the buyer should have been able to safely apply power and signal
under appropriate hookup conditions, and verify operation.

I've never bought a car and opened the oil pan to verify
that it had a crankshaft. Why would I open an RF amp to
check the junctions on the PA devices?

Either it works or it is DOA, and if it does not come with a
DOA return/refund, it should be priced as if it were a known
dead unit -- or explicitly sold as "AS-IS, Untested or Unknown."
It was my understanding in this embarrassing episode that Hammond
sold the amp as a "Known Good" unit, priced accordingly. If so,
the gentlemanly thing to do would be to take back the unit,
eat the shipping charges, and apologize. This is the way I've
always transacted radio business, and I have never had a complaint
and have never been ripped off.

By know, I think we know how likely gentlemanly conduct is in
this case.

Once more: Sellers, expressly declare a warranty or lack of same
on all sales, and stand by that word. Buyers, require an expressed
warranty or explicit lack of same, and demand fair execution of that
warranty. Both sides, tell the truth, keep your word, and deal
fair. With just one iteration of this cycle by all players,
we'd cut the noise level by 90% -- and drive a lot of crooks into
another business, like selling stereo speakers out of white vans.

4-GE MPD/MPA Public Safety Mikes

Part #198801586P2 New in box. List price is $195. Here only $50 + COD shipping or MO in advance and save the COD charge.

Have 4 pcs. all in box.

With this mike you move the antenna from the radio to the top of the speaker mike. You attach the plug to the radio and you can transmit with the radio on your belt.

1-GE MPD/MPA Surveillance mike/earphone

Surveillance mike/earphone combo like the Secret Service uses. Mike and switch clip to your shirt. GE lists for $165, here $50. New.

1-Decatur K band radar unit. VG condition. One antenna. Unit will has switch to allow it to be used in stationary mode or moving mode. Incandescent vacuum tube numbers show both your vehicle speed and vehicle being clocked. Speed alarm (you set the speed for the alarm to go off at) and speed lock. Comes with cigarette lighter plug.
$350 + Fedex COD

1-GE MPD/MPA Starndard Charger

Part #19B801506P11 Standard Charger. Excellent Condition. $25 + Fedex COD shipping from Boston.

1-GE MPS HT/64 channels. 136-151 split currently on Civil Air Patrol and
ham radio splits and simplex channels.

New Large battery and antenna. Also has leather case, "convert-a-com" with mike, and amplified speaker. Will charge unit in the car in 2 1/2 hours. Unit becomes car radio when in the "convert-a-com". Also have a six gang charger (14 hour charge) that I will include if you want it. Works great. Radio is in VG condition. 6 watts out. $250 + COD shipping.

1-Heath HW-101 Tranciever. VG condition. Comes with Heath external speaker and Heath Power supply. No Mike. Original instructions. $150

Thanks for reading this!!

> change the battery.

I've been inside mine for other reasons (Morbid Curiosity, mostly) so
here goes:

Assuming (so casually) that the HTX-202 is laid out the same as the
HTX-404, the process would be as follows:

Use a static-safe workstation and ground strap on your wrist! Remember
that the internals of this unit are tiny, fragile, and, I suspect,
designed for one-time assembly. Go gently.

1. Remove the battery pack I believe the 4 screws under the pack do not
need to be removed, but its been a while.

2. Find a high quality tiny phillips screwdriver that EXACTLY fits the 4
screws at the corners of the metal back of the radio where the belt clip
is mounted. Carefully remove them. They are very long!

3. Check that the back is not being held by those battery pack mount
screws, and gently ease back off. Don't force it! I think there are
some wires from front section PC boards to back heatsink area.

4. Battery should now be visible. It's a round, thin lithium coin cell
with solder tabs and has clear shrink tubing over the ends of the tabs
and wires (in mine). I would draw a careful sketch for location and
orientation before continuing. I think the battery is stuck in place
with foam tape.

5. Assuming you have a replacement battery in hand, use appropriate
static-safe technique to R&R the battery, being painfully aware that all
memory data is now forfeit. Be darn sure the soldering iron is a
low-voltage, grounded type.

6. Carefully re-position internal wires and "stuff" and position the
back correctly. Be sure battery is positioned correctly. The back must
be fully seated and aligned for the next step.

7. The screws are threaded into the plastic front part of the case. Clean ALL the threads of the screws carefully--they will have bits of plastic on them.

8. Start the screws into the plastic front with fingers, being absolutely sure they are properly started so as not to strip the plastic and ruin the front case.

9. Set the screws JUST tight with the screwdriver--excess force will destroy the front case and the screw.

10. Attach battery, reset unit, reload memory if you can remember what you had set up. It should have survived your attentions if you are gentle and take static precautions.

$62 may be reasonable for this touchy work! I assume the battery is reasonably cheap.

Your mileage may vary, and KE4GNK assumes no responsibility, ETC.

Rich, KE4GNK

It is just like the other Icom units go to your vfo mode and go
into set up (press and hold the "SET \ H/L" key) step thru to "TS" mode
(tramsmit split) and rotate the encoder from 5.0 uhf or 0.60 vhf to what
ever split is needed then send it to a memory for keeping. Don't forget to
reset the "TS" back to 5.0 uhf and/or 0.60 vhf or your future vfo inputs
will be offset by your new split settings.

Enjoy!! TOYS! Don't ja just luv'em!

Actually, the amplifier was sold as "used, but functioning at last date of use". It was also tested (driven to full output by a QEI 675 commercial FM exciter into a dummy load) the day prior to shipping it. However, Mr. Herb Swearengen was kind enough to begin his "scam" postings on July, 3, which is actually 8 days BEFORE his amplifier was ever delivered. His previous "gripe" was that the amplifier never existed, but, upon providing a more "correct" address, he soon found out that it did exist. And, consequently, has claimed, ever since, that it was delivered "non-functional".
Mr. Swearengen, as I understand it (unless he decides to chage his story), Mr. Swearengen AT NO TIME applied any power to the unit, but, rather, began an immediate partial disassembly and testing of the components mounted therein. I find this to be rather odd. I do not know of ANY person, other than Mr. Swearengen, who would not have just powered it up (with witnesses, were he THAT suspicious) and put it on the air. I, personally, don't disassemble and test peices of equipment that I have purchased, whether they are used or new. I have always felt as though it would be much better to be able to say, "Well, I plugged it in, turned it on and it smoked!" than to have to say, "Well, I took it apart, poked around inside it, subjected it to voltages from an unknown multimeter, static electricity, etc., then I put it back together (keeping in mind that the LENGTHS OF THE LEADS are used as inductance in VHF & UHF amplifiers) and it smoked!" I do not know of ANY business who will take an item back upon being informed that the item was "tampered with" beyond ordinary use. It just ain't done! If you don't believe me, go out and buy a color television, crack open the seal and take it (still functioning) back for a refund (after telling the store manager that you have "tested the transistors on the circuit board by unsoldering the leads" as Mr. Swearengen has told me.) I sincerely DOUBT that you would get your refund! In fact, if you do, I'd like to know the name and location of THAT BUSINESS!!!

Also worth noting; Until Mr. Swearengen, I, also, have NEVER had a complaint concerning my methods of conducting business, either. Ordinarily, upon finding out that something is wrong with merchandise shipped, I either IMMEDIATELY offer a refund or replacement equipment. However, people like Mr. Swearengen are now giving me good cause to reconsider this method as, I have NO in my mind at all that, I could go, today, and purchase two _NEW_ transistors and ship them to Mr. Swearengen STILL IN THE PACKAGING, and, within a day or two, we would see a NEW "gripe" appear. (The transistors never arrived, were the wrong type, were crushed in shipping, etc.) There is just no end! So, think what you will. I, for one, KNOW what is true and what is not.

Comment. I have one of these radios and I works great. As I bought if from a SK sale I was not aware of one of the mods until I loaned it to a new ham friend to get him on the air. When he brought it back the vfo was stuck on the 800 mhz cell phone band. After reading the mods on the qrz cdrom I found out how to get the vfo back to 2 meters. Anyway anyone considering the purchase should be aware of this way out of band receive mod.

This happened to me too. I sent it to Yaesu & they fixed it. Then two days later it did the same thing. It seemed to break when I hooked up a power supply directly to the power jack. Now I use the Yaesu noise filter thing to supply external power.

ADMS-1C & FT-50R
When I bought my FT-51R I bought the ADMS-1 programmer. It came with
FT-11/41/51R programming software I recently purchased a FT-50R.

1) Does Yaesu send the update software for the FT-50R for free if you
already purchased an ADMS-1 or do I have to buy another one of these
things?

2) Is the FT-50R software similar to the FT-51R software ?

3) Can you buy the FT-50R software seperate for Yaesu?

4) Does anyone want to trade an original copy of the FT-11/42/51R
software for an original copy of the FT-10/40/50R software?

Thanks!
Bob

> Power settings 5/25/50 (instead of 5/10/50)
>
> Other than that I love mine..... Yaesu makes great products.

I also have an FT-8000R and love it! HOWEVER, I have a constant crackeling noise comming from the UHF side of the radio - the speaker SUCKS when the unit is cold (wintertime in the car) and the UHF volume/squech/band change knob quit working last night! The squelch is stuck open, there is no audio, and the band change button does nothing. If I wiggle the knob around the audio starts popping in and out so I know the audio problem is in the knob. Mine unit is going back to Yaesu tomorrow. I WISH THEY HAD AN UPGRADE DEAL - I'D LOVE TO TRADE IT FOR AN 8100!!!

>
>jamesstone at mindspring dot com

The ORIGINAL poster made it clear that he used the diode-tester
function of his multimeter to check the transistors. Whether he
properly disconnected the transistor is probably the item most questionable,
but the diode range on a multimeter WORKS by applying a slight
regulated current source to the leads, and measuring the voltage
across the leads. Typically the current might be 100 uA or 1 mA.

I'd like to add that the last time I checked, we have rights in this country by default. It's not as if we start out with none and the Constitution grants them as this guy would seem to imply. The constitution is all about keeping Congress in line ("Congress shall pass no law that...")

Further laws passed only limit our freedoms - not grant them. There is no law that gives me the right to watch TV either.

Also, the scum that uses the information should be prosecuted for that. Banning scanners isn't going to keep them honest - jeez.

...and of you don't want me picking up your radio waves with my scanner, then keep them out of my body.

Hello all,

I'm in the process of setting up my satellite station and already
own an Yaesu FT-736R. I have an opportunity to buy an
ICOM IC-970A and was wondering if it offers any specific
advanatages over the FT-736R for satellite work? I'm
aware of the frequency capabilities of each radio and the extra
cost of the IC-970, but don't know which would be better for
LEO and OSCAR work.

Any comments would be appreciated. Thanks.

I am the source of these instructions I wrote them.
The original thought was the switch should be up , but after testing
found it needs to be down/

Found the front panel switch has no effect on the AT-160 at all. I
suspect after a few months of the first trial connection to a 706,
one forgot how to properly connect the AT-160 with the 706. It is
easy to do.

The internal switching relay of the IC-751A will not handle the
switching voltage of the heath SB-220. Also ALC is not compatible.
You need to use an external switching relay or build up the circuits
on about Page 85 of November 1995 QST to switch the amplifier.

Gary.

You need a signal generator, distortion analyzer (or SINAD-der), a three port capacitive isolating coupler "T" , 20dB fixed attenuator, and 50 ohm load.

Install the capacitive coupler between the 50 Ohm load and Receiver Under Test (RUT) such that the 50 Ohm Load and the RUT are connected through the lossless branch of the "T". Next insert a modulated signal through the 20 dB attenuator to the capacitive branch of the "Iso T". Adjust the modulation to 60% of rated system deviation. Usually +/-3KHz for LMR FM. Adjust the signal generator to a high output to fully saturate the receiver. Apply the receiver output (deemphasized discriminator or speaker) to the distortion analyser and adjust for full scale (0dB) on the distortion analyzer with the filter disabled. Engage the filter, the distortion analyser and adjust the filter for a null , it should read a very low distortion and should be about -30db or greater down from 0. Now reduce the signal generator until the needle rises to -12dB. You have now calibrated the setup for 12dB SINAD.

Note the value of RF signal output from the RF generator in decibels.

Remove the 50 Ohm load and substitute an antenna placed in the normal vicinity of the noise source. Turn on the noise source and adjust the signal generator output (should need to be increased) until 12 dB SINAD is again attained.

Note the value of RF signal output from the RF generator in decibels.

Calculate the difference and therefore the increased signal in decibels required to attain 12dB SINAD in the presence of noise. That value is the desense. The receiver will need that very amount of additional signal to receive reliably when the noise source is present.

You will probably want to put the computer in various operating modes to determine the worst case scenario. This test will permit you to experiment with sheilding and antenna configurations that might improve the performance.

ISO-T hookup

From: Mark Saunders <tracker@dancris.com>
Message-ID: <33D4733C.60A@dancris.com>
Source record: 169730

Okay,

I know that this may sound a little strange, but... my TF-530 HT drains a fully charged battery inabout 4 hours when turned off. I checked the current draw when OFF and it runs about 175ma compared to 8ma on a working HT.

What would cause this. I need to send it back to Yaesu, but I would like to know more information before I send the radio.

The HT has NEVER been dropped or abused in any way. It has VERY little use. It is only used for road trips a few times each year.

Hi, in tests done on my VX-1, the VHF and UHF snesitivity were meassured
at .3 uV, even up through 175 MHz and 485 MHz. Hpwever on 800 Mhz the
sensitivity was only about 2 uV, OK for very local signals. At least
it's better than the 5 uV speced in the manual.... I'll let you know if
we come up with any fixes to improve it...

Mee too! Me too! Oooh! Oooh!

I have been looking at a ten-tec t-kit model 13*0. These look like dandy
kits. Anyone out there built one?

Hi ,I have the folowing for sale:
ICOM IC2SRA
2 mtr/full range scanner,
Two radios in one.
Have drop in charger with battery,
along with nicad battery pack and charge adaptor.
Radio is in Excellent shape with documentation and orig box.
The scanner has continueos coverage....NO blocks.25Mhz-950Mhz.
$350 firm, and Ill cover shipping.
Thanks for reading,
Rob. KE6ONN

2044. Help with "noisy" ICOM SM-10 desk mike

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-22 00:00:00 UTC
From: "chris dot muriel at analog dot com"
Message-ID: <33d472d3.2008607@news>
Source record: 169735

I have a perplexing fault on my Icom SM10 desk microphone
which I use with an Icom IC970 vhf/uhf transceiver.
There's a background "frying" noise on transmit -which I
can only lessen with the mike's built in graphic equaliser
(i.e. it won't remove it).
Icom themselves do not have a circuit diagram for it -the
unit was made for them by Adonis although badged as Icom!
I've prodded around and can't find an obvious intermittent
component on the pcb.
Has anyone had a similar fault & fixed it ???
Has anyone got a circuit/schematic for the unit ??
thanks..
Chris Muriel (G3ZDM) , Manchester, England.

>
>Thanks!
>

I had the FT-8000 (Which is an 8100 without the kit) Assuming both radios are in good working condition, it's really a matter of user preference, as to what style or whatever you want. The reciever in the TM-V7 is slightly better, at least than what my 8000 was. In the intermod department, one wasnt better than the other. Like I said, about the same.

MY experience however, with the 8000 has been with failures in the reciever circuitry. I am on my SECOND FT-8000, which has even been sent to Yaesu once already for repair, and they fixed one of the problems, CREATED another one, and didn't fix the second problem.

These were the two problems I had with the 8000-

The reciever would make popping noises at random intervals, even with the audio fully squelched and no antenna attached. Yaesu DID fix this problem they did not fix the problem I had with the reciever- the thing would pick up TONS of noise from extraneous sources, like if a car drove by, and the incoming signal was about S5-S7, the ignition noise would kill the signal off. I still hear a little noise on the TM-V7, but the noise wasn't nearly a bad as what the 8000 was doing.

HOWEVER- there was a point in time where the 8000 worked good, aside from the popping noise, for a period of about 2 months or so. During this time, the radio worked quite well....

I bought the TM-V7 because I liked the features, and at this point I was profusely sick of the 8000. I figured if I bought an 8100 Murphy would come back and strike me down again.....

Just my .02

>in the lab and test it.
>
>Kevin
>

Well, the 8000/8100 IS less sensitive, and out of band the sensitivity
goes in fits and starts- I wouldnt be very surprised if the unit is
nearly DEAF up around the 1GHZ range.

I think its pretty stupid, but like that "Lets sell off 2M/70cm" Ploy
it will never work. Same with the cellular thing. Cell has been
banned for quite some time, yet equipment that can pick up Cell is
still fairly abundant.

Greetings all.

Aquired a Large (1'x2') meter withseperate fwd and ref scales.
It was made by MCS Inc. Model ATN 1000

It looks like it can handle 1000W by the markings on the meter.
There are two notch holes cut out of the front pannel as well, one marked
phase, the other loop.

On the circut board next to the cores is stamped
Rev B 250-1020 MSC ASSY.

There are several holes and ports on the back as well as 1 N fitting.
It is marked RF IN.
The RF out seemed to be a special adapter / port.. just a large 2" hole now.
Any idea?????????

> laws about it: "Congress shall make no law...".

OK, now explain to me where slander and libel come from. If the
Constitution protects the right to free speech then there can be nothing
that restricts speech and it's content, but there is. Explain to me
about the 2nd amendment. Numerous laws have been passed restricting this
right also. It seems that the simple ability to travel in the country is
a right under the Constitution but driving has been ruled a privilage
and not a right.

I am extremely familiar with Constitutional law but the problem is that
the Constitution is no longer followed. Furthermore, our society has
gotten to the point that if it's not on paper it doesn't exist,
regardless of the original intentions of the founding fathers.

So here's my point. If you want a right in today's society you damn well
better make sure it gets in the Constitution by amendment or the courts
and the legislature will regulate it for you. And even having it in the
Constitution is no guarantee that it is a right today. Just look at the
2nd Amendment.

I'm the fellow who wrote this software. I see no reason why it
shouldn't work on the MKII, but to my knowledge no one has tried
it yet. If you download it and try it with the MKII, please drop
me a note and let me know how you made out.

I really suspect that no changes were made to the computer controlled
command set.

2063. Icom IC-Z1A mods for wideband rx. ?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-23 00:00:00 UTC
From: jsmollen@utk.edu
Message-ID: <33d5ec18.1295738@news.earthlink.net>
Source record: 169555

Does anyone have a mod for the Icom IC-Z1A beside the # + B + PWR ?
That works to extend the coverage a bit, but seems to peter out above
500 mhz or so.

Also can anyone point me to the diode to remove for extended transmit?
I have read the mod files and looked in that radio till my eyes are
crossed, and still can't seem to be 100% on which one to remove.
With surface mount components I hate to pull the wrong one.

Thanks in advance
jim

You are both wrong. A transistor/diode check position of a digital
multimeter supplies its own 5 ma bias current and measures the drop at
that current rate.

>giving a high swr. The 4 pin plug is correct pin for pin.

Huh? The 4-pin connector supplies power for the tuner and doesn't have to be "messed" with. What I was talking about was the multi-pin connector on the 706 (14-pin? I don't have the rig here to count the pins) to the DIN connector on the 160.

Once the 160 tunes to a frequency, there isn't any reason to press the tune again as the 160 "remembers" the correct setting. I tried the tuner into a Larsen 5/8 2-mtr antenna, and it tuned the rig to 1.1 on 10, 15, 20, 40, and 80. Signal reports were excellent, and neither the tuner nor the radio seemed to have any difficulties.

Hello everyone,

I finally found some amateur radio related news groups thanks to a
friend of mine. Id like to call your attention to the latest and (I hope
soon one of) the greatest amateur radio websites on the net.

My site is still under cunstruction but the primary structure and basic
links are there. More links and content will be added every couple days
as my time allows and I locate more links.

This site is at http:/www.qsl.net/kc8aco and a big thanks to Al, K3TKJ
at http://www.qsl.net/ for providing space for my pages.

73's to all and happy browsing.

> 73's NS1R Steven Hershman

I found out from Icom that the Intermod update kit is on serial #1000
and up. I have serial # 43914 so I must have it. I only have the problem
at Three areas in Boston area. I have heard a few guys complain about
the Heat sink getting hot and burning up the traces on the PCB in the
radio. I installed the radioshack 2 1/2 inch DC muffin fan on top of the
heat sink. I used plastic tie wraps to securely mount it. The radio runs
cool to the touch even at 50 watts at heavy duty cycle. Before I could
have cooked a egg on it.

I have the V7A. It is a fabulous radio. Slick, smooth, and VERY
functional. Also,
completely remote controllable from any recent knwood dual band handi.
Personally, i don't think you can go wrong with either rig. The blue
display got me,
but the rig just works great on top of that....I second all the remarks
on the previous
post....Regards,,,Mark -ab4ye

Does anyone know what the Motorola part number is for the finals of a
GE MASTR II 110 watt PA deck ?

Also trying to figure out what the difference is between a UHF and a
VHF 5C ICOM. They have the same part number but a different suffix.
The real question is can I use a VHF 5C ICOM in a UHF receiver ?

Many thanks

Hi,

The 733 is fairly notorious for being "intermod-prone." In heavy RF areas, it hears more intermod (pagers, mostly) than some other radios. The comment from the fellow using one with no problems in LA was interesting, but not typical. The A.I.P. helps some, but reduces the overall sensitivity as well. The intermod gets a little worse when using the radio for VHF-VHF or UHF-UHF operation.

The radio is fairly complex to program. Once programmed, the memories and "programmable memory" keep operation fairly simple, as long as you don't need to get away from what's already programmed. Totally manual operation can be a bit complicated. A cheat-sheet helps. If you're the type who loves a button-pusher delight, it will be no problem. All that button-pushing buys you a very flexible radio.

9600 bps packet transmission is prone to high bit-rate error (you'll get a lot of "rejects," and some radios seem to have a problem breaking into oscillation as 9600 deviation approaches the recommended 3 kHz (I can get just over 2 kHz deviation out of mine before it howls like a banshee, but that's good enough to hit my local BBS).

My conclusion: not a bad radio, especially if you're paying $400 or below. Check to see if you're getting the newer, back-lit mic. But it doesn't compare to my Standard 5900 in intermod-rejection.

I have 3 Alinco DJ-S41T (340mw, 70cm) HTs. If there's a hill between my sons and I, we can't even go 1/2 a mile apart. Most of the time we can go about 1 or 2 miles, BUT it all depends on where we are.

I've also been able to hit a repeater about 25 miles away; however it's at the top of a VERY tall hill.

The lower frequency of 2 meters will offer a little more "bend" of the signal around the hills. Still, I wouldn't expect too much; VHF is line of sight only.

Bob,

I've used a Kenwood TS430S mobile for several years now - while it's a bit large for small cars, it fits nicely between the seats of my minivan. The noise blanker is superb for ignition and fuel pump noise. I picked this thing up for used $500 (with a kenwood power supply!) about five years ago and haven't regretted it yet.

Also run an Icom 735, smaller by about an inch in every dimension. It has a slightly better receiver than my TS430, noise blanker not quite as effective. This rig also picked up second hand in mint condition for $450 just a few months ago.

Good luck & happy HF mobiling!

Harold,

to program oddball or commercial service splits, you go into the Set mode and press the up or down key until you see the digits .600 displayed. You can then set the offset to be whatever you want. The frequency and it's oddball offset can then be put into a memory channel.

Don't forget to set the offset back to .600 when you're done, otherwise you might be embarrassed when setting a repeater up in VFO mode...

Cheers,

Mike, N5MJ

Has anyone had "CERR" pop up on your 50R when attempting to move memories from the ADMS software to your 50R?

I have a friend who has this problem every time he attempts to load his HT with memories from his software. Of course, the software eventually times out as well. Is this a possible problem with the radio? The interface seems to work fine with his other ADMS programmable rigs.

I would appreciate any info that you can give me.

:Any information would be greatfully received.
:
:Regards Andrew Laity VK3AHD

I bought one new from a company that offers a 14 day return policy.
I decided to return it and get an FT-3000 instead.
Although I do have an appropriate license I rarely get on the air
so I figured that the bells and whistles of the 3000 was of more
interest to me than the extra transmit band that the 8000 offers.
I did find that the 8000 picks up lots of spurious transmissions
in the 300 and 900 Mhz range even with an indoor antenna. That may
not be a problem. I did not try the 8000 in a mobile situation.
Since I only gave the 8000 a quick test I can not advise you either
way.

Barry

No I am correct press the tune button again once you have a good match. You likely will find the tuner will not tune again, thus giving a high swr. The 4 pin plug is correct pin for pin. Open the case and watch the capacitor, it may not be swinging around.like it does with the switch in the down position. The cap follows the band switching voltage and will do a preset each time you change bands.

==========
Motorola Radios & Accessories (see below for more info)

$400 shipped for the lot

qty 1 HT50 154.6 MHz
qty 4 HT90 154.6 MHz
qty 3 HT90 154.57 MHz
several partially assembled HT90s and HT50s

qty 1 NTN4864B charger
qty 6 NLN7646A charger
qty 6 NTN4864A charger

qty 14 NLN7434A & similar batteries
qty 1 NTN5453A battery

qty 13 BNC whip antennas various lengths
qty 1 HT50 screw in antenna

I would like to sell all this together if possible. The chargers are in decent cosmetic shape, some have marker writing on the front. The radios are somewhat more beat up. All of the radios were used for data transmission, all have had the accessory jack removed. Some have a short coiled cord with a strange connector in place of the jack, some have nothing at all here. I have tried most of them, however, and they all seem to function anyway. The condition of most of the batteries is unknown; I charged up a few to test the radios, that's it. Because of the condition of this equipment, I offer no guarantees on it.

> 73's NS1R Steven Hershman

Hi Steve:

I had the opposite - great immunity but turned out that the
front end was down about 5X what it should have been. Icom
fixed it out of warranty and put in a new display without
my permission or request and charged me $120.00.

So I got rid of the radio and got a Kenwood TM-V7A (Cool
Blue Dual Bander) and love it.

See ya on 64...

Also, the repeater offset is part of the information stored in memory
channels. If you dump a frequency from memory back into the VFO, the
offset goes with it (even if the memory is set for simplex).

> 73's Steven Hershman NS1R

I heard from several guys on the NewsGroup that Icom has a "INTERMOD
MODIFICATION UPDATE" that will solve the problem but leave out of band
signals deaf. Icom can't tell me if my radio has this s/n 043914
so I guess I will send it in under Warranty (3 months old).
If I knew the radio would have this problem I would have steered clear
of it. I am looking at the new IC-756 but will wait to see if Icom will
cure the intermod problem under warranty.

To set this, try the following key entries:
F[M] then 7...small P or 5 displays to show current mode...
press F[M] to toggle...and 7 again to return to normal display

> 2. How to scan tone frequencies on a busy channel to find out what tone
> access a repeater is using.

Put the radio in Tone DECODE mode...then select Tone freq F[M] then 2
with tone freq displaying, press up or down button and hold...it will
start scanning and stop on active tone if present (unit MUST be in
tone decode mode for this to work)

The Heils have too low of a mic output to easily drive Icoms. I use
one as part of my contest set-up at home with an IC275H 2mtr all-mode.
Have to run the mic gain all the way up. I think Bob Heil was to
have come out with an add-on pre-amp. Maybe AD7K can help; I believe
he was the one to mention it a while back.

> to supply external power.

It doesn't take much of a voltage spike to short out the regulator, IC,
output transistor, etc. Filter is a good idea. Another thing that
often
happens with external supplies is due to the "backward" design of the
power input jack. Many radios break the ground connection and insert
some sort
of current limiting when you plug in the battery charger or external
supply. If you're using a grounded supply and a grounded antenna
as in a mobile, you short out the current limit and all hell can
break loose.

I encourage you to read a book on constitutional law. The earlier poster was exactly correct; rights like freedom of religion, free speech, the press, etc, are held to occur naturally. You have these rights just because you're a human being. The Constitution protects these natural rights by placing limits on government. The first amendment does not grant you freedom of speech; it protects it by prohibiting Congress from passing any laws about it: "Congress shall make no law...".

I've seen several different ways to mod. the super cpmpact rig. (VX-1R).
Does anyone know any other way to mod. it with as little glitches as
posible. Forexample, Full VHF/UHF and cell (800-999). IF so please
contact me my HAM club is debating whether or not to go super compact.

I am interested in your L4B. Where are you located and how much do you think to ship? How are the capacitors in the power supply?

Overall on a scale of 1-10, what condition is the AMP. I am looking for one to match my B line, but it has to be at least a 9.8 on a scale of 1-10. It took me a long time to get a B line in this condition, and it may take as long for an L4B to match, so that is why I am being picky.

If I wasn't trying to match I would be so picky!!!!

2122. FS: Kenwood TS-440/SAT + More!

Hello All;
I am selling the Kenwood TS-440SAT with the optional PS-50 power
supply and optional Kenwood MC-60 amplified desk mic. All has less
then 5hours of use. I'm the 2nd owner. The 1st owner purchased this
unit not knowing about his qth's restrictions on no outside antenna
laws. Both of us are non-smokers..
Also all original paperwork, cartons, user's manual, covers
for the 440 & PS-50 & optional service manual are included. I have
the MFJ-1272BX tnc-microphone switchbox also if interested..
Asking $750 for TS-440SAT with both manuals, paperwork
cover & original carton. This unit has the auto
antenna tuner, been modified for "MARS" and the
optional 7 digit LED read out. Has 100 memories
plus much more.. We detail if interested
Asking $175 for PS-50 with cover and original carton
Asking $85 for Kenwood MC-60 desk mike
Asking $980.00 + shipping. For all the above Or Best Offer.
This is a must see hf setup and I would prefer any potential buyer
to see all the above before buying.. This is One Great Setup..
Reason for selling is strictly financial. Please re:me either through
Packet: N2RIF@WM2F.#SNJ.NJ.USA.NA
Or Better
Email: n2rif@amsat.org
My phone# is: (609) 386-9382 but sorry it is busy most of the time.
You can try though anytime from 10am to 10pm ET..
Thank you for reading my sale's bulletin.

Most parts come off pretty easily with a hot-air gun. You have to play
with the temperature and time a little. For delicate stuff, grab it
with tweezers while you heat. for ordinary rugged ics, turn it upside
down. Heat it up and give it a whack. The parts will fly off.
Wear eye protection.

No there aren't. Configuration Group 1 and Group 2 are merely different ways of using the *same* EEPROM. You can program the radio in Group 1 mode or in Group 2 mode but not *both*. The Group 2 method won't let you store all the things the Group 1 method does. That's how it gives you more "memories", it uses some of the EEPROM used in Group 1 mode for storing splits, tone frequency, etc to store additional simplex frequencies. There is also only one set of band limit memories, BC band memories, and smart search memories, you can't count them twice.

In either Group 1 or Group 2 mode, you have the 10 BC band memories, the 20 band limit memories, the 31 smart search memories, and 8 home channel memories (one per band). That's a base of 69 memories. To that you can add *either* the 52 channel memories of Group 1 *or* the 142 channel memories of Group 2 (not both). So you wind up with either 121 memories or 211 memories. In neither case do you have the 290 memories claimed on the box.

There are also 8 15 digit DTMF memories. I don't think the DTMF memories should be counted in the total though. And even if you did, counting them as either 8 or 8*15=120 memories still doesn't total to 290.

>I am confused about one thing... what is the charging time for the
>battery? Ads indicate either 1 hour or 80 minutes (latest QST), the user
>guide indicates two hours.

The user guide is correct for the included charger. BTW, buy the mobile DC cord. It is a great deal because it will either let you run the radio at high

power or charge the battery while you're mobile (depending on whether the radio is on or off). You can't really *use* the radio while mobile, because the audio output is too low to overcome road noise, but being able to recharge the battery in the car is a plus, and you can use the radio on high power when you're stopped. Note too that unlike some NiCad batteries, you can partially charge and discharge the lithium-ion battery repeatedly without any ill effects.

>Despite the flaws, I think the radio is great, esepcially for its size.

The only real flaws the radio has in my opinion are poor receive sensitivity in some bands (but it beats the specs printed in the manual so you get what you're paying for) and low audio output. I consider the latter a real flaw for use in even moderately noisy environments. An earphone is virtually mandatory but *one is not available* without getting a remote mic too.

I don't need a remote mic, the radio is small enough to serve that purpose, but I want to use an earphone. Yet I can't just use an ordinary earphone because of the odd mic/ear jack. Bummer. Of course you can custom wire one up if you can get the odd plug, or buy the mickey mouse adapter that is available. Yaesu should really include a bare plug with the radio. Other manufacturers include any odd plugs that their radios use, IE Icom includes the accessory connectors with their radios. I'd even be satisfied if Yaesu would *sell* you a bare plug. Buying a clone cable and cutting it up isn't very elegant, or cost effective.

I do wish the radio covered TV channels 2-6 though. The radio makes a nice off-air monitor receiver for TV remotes, but only if your station is on channel 7 or higher (fortunately mine is). This will become moot in a few years anyway as we switch to DTV, but for now the little radio is useful for this.

The radio is surprisingly free of birdies and doesn't appear to suffer too badly from IMD. That really surprised me. And the half watt output does make a noticable difference compared to my Standard C508A. But the 800 MHz sensitivity is a real disappointment compared to the C508A. Needless to say, the supplied rubber dummy load needs to be replaced by a better antenna, but that's typical of all the current crop of HTs. It's smaller than a pager, easy on the battery, and I like it. I bought the alkaline battery adapter too, but that seems of dubious utility, a spare lithium-ion battery is probably a better bet (and at least that's reasonably cheap, but I want a drop in charger for it I can use in the car).

Yaesu deserves major praise for including both block diagrams and detail schematics with the radio. (A board layout would be welcome too, of course.) Icom deserves a major rasberry for failing to include schematics with its recent offerings, and Standard only includes a block diagram. BOO HISS to amateur manufacturers who don't include this basic information with their products.

Your just mad because he got rid of his junk (icom) and got a real
radio.
I know icom is junk because I have a IC-706 and it has been in for
repair 2 times and icom still cannot find the one hundred watts of power
on single side band it should have.ICOM just sends it back saying it
puts out 30 watts on voice peaks.I sure would like to know where the
other 70 watts are?It's funny because people think the radio has the
power but when they check it they get a dumb look on there face when
they see they've beem taking for a ride.

Loosley translated thhe 9th Amendment states that all rights need not be
listed and just because they are not listed are they denied. This is
also not what I meant in the comment you quoted. Our founding fathers
could not possibly have enumerated all possible rights that existed in
their day let alone foresee certain activities that would exist today.

My point was that certain basic rights are so obvious and fundamental to
humans that they were listed in the Bill of Rights to specifically
prevent any tampering with them. However, as a reality and most
legitimately those items that are not listed may or may not be rights;
it all depends on a persons particular point of view. Where there is
disagreement the courts and legislature must fill the void.

> Governments cannot grant rights, only bestow privileges on the few at the

> Operating a motor vehicle *in public*, however, can be constrained

> to the extent it poses a grave danger to public safety. The government
> does not and cannot prohibit a person from operating a vehicle on private property under his control.

Depends on what state you live in. Certain states have laws which simply prohibit operation of a motor vehicle without a license. The law does not specify on public or private property. Also, certain states prohibit the sale and or transfer of a motor vehicle without proof that the buyer is licensed and insured regardless of the eventual place of operation.

Lastly that was not what I was talking about. Numerous people believe that since the government saw no need to license the rider of a horse or regulate this behavior then the government has no right to regulate the operation of a motor vehicle. My point is that there exist many who believe driving a car is a fundamental right today just like riding a horse was a right for their forebearers and thus cannot be regulated. Since you and I believe this is not the case we are in disagrement with them and therefore what is perceived as a right by some may not be such and is open to interpretation.

Once again that was not my point. There are those that argued that the airways were free and the government had no power to control here either. I say it can, and in fact it does, as we both know.

A radio transmission is
> an utterance made in public, IE the same as shouting on a street corner.

Actually the government took control of the airways under the interstate commerce clause of the Constitution, it had nothing to do with public behavior. Furthermore let's not confuse sight and hearing with electronic means. You can easily avoid certain frequencies and risk no harm but it is potentially dangerous to close your eyes while walking or driving a car, and unless deaf impossible to stop hearing what is said loud enough for you to hear.

Unfortunately some argued that encryption of Police channels was a
violation of their right to listen. I say no such right exist.

Patrick

Yeah sure, that's certainly a self-serving attitude. Who insures those reports are the *truth* if there is no independent way to monitor what actually happened? The idea behind public monitoring of what police do is to prevent corruption and misuse of government power. Are we then to simply take the word of the police that they're on the up and up? Do you just take the word of a suspect? I didn't think so. You go out and conduct surveilance to see what's actually happening. That's what monitoring police radio allows the public to do (in a limited way).

In the past year my station has exposed a string of police corruption scandals ranging from police officers running murder for hire schemes, operating robbery rings, dealing in stolen goods, shaking down citizens, beating and raping motorists, etc to the more mundane graft, malfeasance, simple bungling and abuse of public trust that police routinely engage in. None of that would have come to light by reading their self-serving reports down at the station house. But use of radio monitoring and hidden cameras caught at least some of
them.

Who guards the guardians? It generally isn't internal affairs. In most departments that's a joke. It takes the press and alert citizen action to bring police misbehavior to light in most
cases. Monitoring police radio is one of the tools which makes that possible because it allows us to keep tabs on where police *say* they are and on what they *say* they are doing. Most of the bad apples were caught because what they *said* didn't match what they were doing. Monitoring their radio transmissions can serve to act as something of a cross check on their behavior. When we find police incorrectly reporting their locations or actions, that's a red flag to start a careful surveilance of that officer. It has paid off for
us.

With so many police today dressing and acting like criminals, it is often hard to determine which is which and when police are performing legitimately and when they are themselves engaged in criminal activities. (I seriously think that police operating out of uniform or in
unmarked cars should be subject to immediate termination, we shoot soldiers out of uniform as spies, why should we treat police differently?) We even caught one gang of police attempting
to pull a scam on another gang of police (who they didn't know were police) and getting into a
gunfight in the parking lot of a local nightspot. *That* made for some hilarious tape (one

hoped
both sides were better shots).

I'd like to add here that most police seem to be basically honest and want to do a good job.
But there are plenty of bad apples, and plenty who think they are in a war where they can use any means at all to accomplish their ends. Citizens wind up being harmed by both of the latter sorts all too frequently. In fact I think that the outright crooked cops are often
less harmful than the zealots who abuse their authority.

The military is also required to be in uniform, otherwise they can be shot
as spies. Perhaps the same standard needs to be imposed on police.
The military isn't used against a nation's own citizens (at least not under
our laws) but police are. Thus police must be held to a higher standard than
those in a military unit. If that makes your job harder, tough, you knew
the job was dangerous when you voluntarily took it. No one drafted you.

I'll offer a guess (it's worth what you pay for it). I'd suspect the
FET coming off the microphone element. Frying noise is usually
excessive flicker noise, and that's due to a defect in the transistor,
typically a cracked substrate.

Not where I learned my antenna theory - a monopole above a ground plane
behaves exactly as a dipole remote from the ground. The error seems to be in
the assumption that the monopole generates twice the field of a dipole. For

a monopole above a ground plane, the power is dissipated part into the air (useful radiation) and part into the ground (non-useful). It has to be so else how is the (virtual) image formed?

On Mon, 21 Jul 1997 22:50:28 -0700, Patrick Lynd <patrickl@wco.com> wrote:
>I also understand that the Constitution doesn't cover all rights in this
>country, but it is questionable, if it is not specifically mentioned in
>the Constitution, if a particular activity is a right.

The founders addressed this in the debates over the Bill of Rights.
Some were afraid that people would place the interpretation you do
on any finite listing of rights. They were pooh-poohed by those who
said everyone knows rights are inherent and inalienable properties of
the human condition. Apparently the skeptics were right to be concerned,
even though Amendment 9 says "The enumeration in the Constitution,
of certain rights, shall not be construed to deny or disparage others
retained by the people."

Governments cannot grant rights, only bestow privileges on the few at the
expense of *infringing* the rights of the many. That's why government power
must be strictly limited and closely watched. The Bill of Rights is a specific list
of *prohibitions* on government infringement of certain rights considered
fundamental to the proper functioning of the Republic.

Primary among those is the freedom from infringement of the right to speak
out freely against government, IE the First Amendment, and backing that right
is the prohibition on government infringing the right of the individual to bear
effective means of resisting infringements of his rights, IE the Second Amendment.
As has often been noted, our freedoms rest on three boxes, the ballot box, the
jury box, and the cartridge box. The latter is necessary to ensure the other two
aren't infringed by governments gone rogue.

>There are those
>who believe that the operation of a motor vehicle is a right, but in
>fact it is a privilage.

Freedom of movement is a fundamental human right, inherent and
inalienable, and must be accomdated by any legitimate government.
Operating a motor vehicle *in public*, however, can be constrained
to the extent it poses a grave danger to public safety. The government
does not and cannot prohibit a person from operating a vehicle on private
property under his control. But the limitation placed on operation on public
highways is a matter of public safety, and is not inherently intended to limit
freedom of movement, IE those deemed incompetent to safely drive in
public can still ride as a passenger or walk.

>I believe that listening to police information
>is a privilage and not a right. If airways were not subject to
>governmental control then I wouldn't need a license to operate on the
>ham bands.

Note that you *don't* need a license to *listen* to a radio. Don't confuse permission to transmit with permission to listen. A radio transmission is an utterance made in public, IE the same as shouting on a street corner. People within earshot of such utterances don't have to seek permission to unstop their ears. Nor are people obligated to close their eyes as they walk by your home if you insist on walking naked in your house with the blinds open. The onus is on *you* to keep such things private as the transmitting party. Unfortunately, certain current laws attempt to in effect force people to stop their ears and close their eyes when certain others make public utterances over radio, but that doesn't make such laws just or morally defensible. (The correct reaction to such laws, however, is not to willfully break them but is to work to get them stricken.)

>As another poster points out this will all be a moot point soon.
>Encryption will kill scanning.

Exactly. This is the correct response to privacy concerns about utterances made in public. It is the responsibility of the transmitting party to ensure privacy. It is never morally defensible to impose limits on others to accomplish benefits to yourself that you properly should secure through your own actions.

I was told on the phone yesterday that there will be programming
software available for the VX-1R in 4-5 weeks.

ADMS-1C provides separate modules (programs, directories, etc) for the
FT-51 and FT-50. I presume this will be a new package that adds the
VX-1R to the menu .. vs. an upgrade.

That's kinda like saying, "Sorry Officer, I was going too fast to see
that stop sign". It's a damn poor excuse. And it won't get you off the
hook.
The radio design team
had their heads in a dark place and did not consider the needs of users.
We ought not be making excuses for them.
I'd buy one in a flash it it worked...hell, it's so cute I might buy
two...
You listening Yaesu??

Much of the restriction we have on our rights come from the assumption
that each right has responsiblities. I can believe what I want but if
putting them in action would harm another then I am limited. The same
for speech (to include my responsiblity to take rebutal). And I can
defend my ideas but am not permitted to offensively use violence in
promotion of my ideas.

I purchased an FT-920 over IC 756 because:
1) Provided technical info, including dealer comments indicated
superior DSP on 920
2) To me, the 920 has a better display for long time viewing and
off-angle visibility.
3) I prefer MOS FETs to bi-polars for cleaner transmissions (QST had
problems w/756 on tx., even after Icom mods).
4) Minor other features appealed to me favoring the 920 (i.e. 232
output,etc.)
5) At field day, one new IC 756 (May or June date) would not
transmsmit properly or had an unusual weak signal when trying to
contact perfectly readable signals. Older Icoms and Kenwoods did not
experience this (simple 20 M dipole).

Have not received the 920 yet, but I believe both radios are very
close in specs (with slightly different receive IF section designs).

2156. New HAM Looking For Used Equipment

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-24 00:00:00 UTC
From: andrew@privateI.com
Message-ID: <andrew-2407971115580001@ppp6.privatei.com>
Source record: 169511

Thanks for reading this post!

I am a beginning HAM looking for used equipment at used prices. I am a student and don't have a lot of money to spend. If you have an inexpensive base system or even an HT that you could sell to me for a small price, please email me. I know that many experienced HAMs tend to have many radios that they don't often use. If you are one of these, please help me.

Thanks for your time. I hope to hear from you soon.

2158. WTB Altair 8800 computer and related items

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-24 00:00:00 UTC
From: Bob Wood <RWood54741@worldnet.att.net>
Message-ID: <33D797B3.5E32@worldnet.att.net>
Source record: 169513

I am looking for the following items...

Altair 8800 computer
Altair floppy drive
small paper tape readers (OAE, Addmaster, Proko, etc.)
punched paper tape with either the MITS, ALTAIR OR MICROSOFT brand
Altair cassette drive
software on cassette with the MITS or ALTAIR brand
S-100 circuit cards with the MITS brand
any literature or docs on the above items

Thanks,

BOB

2160. Kenwood TS-180 protection circuit & gamma match

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-24 00:00:00 UTC
From: Jim Garver <k7@teleport.com>
Message-ID: <33D7A30C.7848@teleport.com>
Source record: 169515

We built a gamma matched beam for 10 meters and matched it close to
1:1 SWR. It works fine with other rigs but the Kenwood TS-180
trips its transmit protection circuit using SSB or CW. If the
series capacitor of the gamma match is removed it won't trip but
then the SWR is high.
Is there something strange about the TS-180 transmit protection
circuit? I found info on a mods page that indicates similar
problems when using the TS-180 with a relay-switched linear amp.
How could a resonant series reactance cause such a problem?
Does the TS-180 use something other than an SWR detect circuit for
final protection? We can get it to transmit into the antenna, but
only on the first key-down. Further keying or modulation trips
the protect circuit. Weird...

Thanks for any help,

Jim K7YO

> (snip)

It's easier than that. Use a small torch, or one of those
high-temperature heat guns. Works for SMD too - like reflow
soldering in reverse. Just be careful... :-)

My favourite technique for removing chip resistors and capacitors
is to use two soldering irons with little tips. Heat each end of the
component, and then use the two irons as tongs to lift it off. Easy!

I have come across a couple of unusual tubes.

They are labelled CV 2271 KB/G and GC10 B/S.

They look like they may be a kind of a magic eye style
indicator tube.

Could anyone shed some light on what they may be used for?

Please reply to csc@smartt.com if you have any info.

>
>Keith G Malcolm
>24 July 1997

Keith is right, though for the wrong reason. Lets look at it another way.
Lets assume two ideal antennas, one a dipole in free space, and the other

a 1/4-wave monopole over an ideal groundplane. Lets feed each antenna with 100 watts. Now the feed impedance of the ideal free space dipole will be 72 ohms and the feed impedance of the ideal monopole over an ideal groundplane will be 36 ohms.

The current in the element is given by P=I^2 * R or I=sqrt(P/R). So the dipole will have a current of 1.179 amps and the monopole will have a current of 1.667 amps at the same power level.

Now radiated power is proportional to I^2 * L (Radiation is the result of accelerating charge), where I is the RF current in the element and L is the length of the element.

Substituting in for I and L for the dipole case we have an I of 1.179 amps and a length of 1/2 wave, that gives a radiated power of 0.694 (arbitrary units). Now for the monopole we have an I of 1.667 and an L of 1/4, that gives us a radiated power of 0.694 again. So the two antennas have exactly the same radiated power.

In the *real* world, the monopole will be over imperfect ground, which will be reflected as a higher feed impedance, so its radiated power will be lower than that of the free space dipole. How much lower will be a function of ground conductivity. Its pattern will also be skewed upward compared to the ideal groundplane case. That's why a dipole mounted high will almost always beat a ground mounted vertical in the real world.

2167. Q: Alinco DR-610T Backlight Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-24 00:00:00 UTC
From: jcwren@atlanta.com
Message-ID: <33ecbd27.192850784@nntp.atlanta.com>
Source record: 169522

Has anyone out in netland had a problem with the back lighting
of their DR-610T control head flickering, or going out? Mine started
life fine, then the right side started flickering, and mostly went
out. Now the left side has started this behavior, and the left side
stays mostly dark.

I don't think (for sure) that it's a mechanical problem, since
thumping, tapping, flicking, shaking and rocking the control head seem
to have no effect on it. There might be some temperature
relationship, but nothing I've pinpointed.

I don't mind opening it up, but I thought I would throw this
out before I managed to completely wreck mine.

Well, Mark, now I need a sanity check.

The dipole and monopole calculations for antenna radiation resistance,
etc.... that I've seen were calculated over a perfect ground. And
since
the radiation patterns for both the 1/2 wave dipole and 1/4 wave monopole
are the same (over the perfect ground, both vertically oriented), the 1/4
wave
monopole loses out since half it's radiating pattern is in the image below
the ground and the other half up into the air. So, thus the 1/2 wave
dipole
is double the 1/4 monopole.

And even if they were both oriented horizontal, the 1/2 wave dipole is
still
double the 1/4 monopole? Need help with this one, please.

Your antenna height, ground wave, etc. well taken.

Regards, Doug "my antenna theory is suddenly old"

Yes, but as has been mentioned earlier, you need to remove the
transistors to avoid getting false readings from the bias components.

Try diode checking a a few different value resistors and see what you get. Also, correct me if I'm wrong but this works on bipolar transistors only (and diodes).

Patrick,

Please remember that all police officers are public employees and we are paying your wages. Everything that you do as a police officer is in the public's trust. Everything the police uses is owned by the public. What do you feel you need to hide or obscure from the public by denying access to the communication frequencies that you use? What separates the general public from the media when it comes to how access is granted to your work? All frequencies should be free to be monitored. If you don't want yourself heard, encrypt. You'll then find out why the government has such an anti-cryptogrophy stance. Should we return to the days of Nazi Germany when information was suppressed from the public? Do we need to live under a fascist totalitarian regime? Is there not documented cases of scanner users assisting the police and other public services? If you report a crime suspect wanted by the police and I hear your conversation and see the suspect and then report it to the police and the suspect is apprehended, doesn't that justify my monitoring of your traffic? Can you conceive of no use for the public monitoring public service frequencies? Are we to rely on your police reports for 100% accuracy without discrimination?

Dirk:

Try also to keep in mind that I'm a taxpayer too. Everything that the military uses' belongs to me also but I am not entitled to listen in on their traffic. I have to trust that they know what they are doing and hopefully it's in the best interest of the nation. I may not like this but that's the reality of the situation.

There is nothing that separates the public from the press when it comes down to equal access to police records. What separates the public from the press is the willingness to do it. As I have stated before, scanning is fun ->for some people<-, scanning is exciting->sometimes<-, but it really is not a method of monitoring police activity to insure we are doing what the people want. This is only an excuse to give it some high moral value because some now think that scanning police channels may become a thing of the past.

There are in fact documented cases where a citizen listening to a scanner has aided the police. There are also documented cases where they interfere with police operations and in one case I know of a citizen was killed by a police officer when that citizen tried to assist the police. As you can see this is a two edge sword.

In any event this law probably stands little chance of even getting out of committee and sooner or later all departments will be encrypted and this will be a dead argument.

2178. VX-1R Experience/Question

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-24 00:00:00 UTC
From: jcwren@atlanta.com
Message-ID: <33dd60b7.169186226@nntp.atlanta.com>
Source record: 169533

Hello.

I've just bought a shiny new VX-1R, and so far I like it (in spite of the problems about scanning only within the current band, and a memory being committed to a band once written to).

I've done the mod, but to my dismay, found that I can't transmit in the 222-225 (ACT-1) band. Has anyone else had this experience? I see that I can key the radio from 128 (haven't checked any lower) to 221.999. But from 222 to 299.999, no transmit.

I bridged pads 0 and 1, did a hard reset of the radio (AR + M/V + PWR, then the F key). I've got firmware A105.

Any thoughts? (postings appreciated, e-mail preferred).

Yes. You are right this only works on bipolar transistor and diodes. But
it is not necessary to remove the transistor if you disconnect the base
lead from the circuit. That way there is no complete path for current
except through the emitter-base junction. In the case of a base-collector
or collector-emitter short, though, your reading might not be correct--
but then the transistor is defective.

The transistor I was measuring was ECG-352 which is an NPN silicon
transistor. I have since replaced them with good ones and the old ones
when removed completely from the circuit showed the same reading out-of-
circuit that they did in-circuit with the base isolated.

Source record: 169536

While a few of your points are valid, many are controversial. Yes, the police are by definition, public employees. The media and public do not have free access to the frequencies for several reasons. If others were allowed to listen in, how could an officer, or the public, be protected during a covert movement? If someone broke into your home, and took you hostage, would you want that broadcast? How about if the assailant had access to the police frequency, and knew every move they made? Oh, yes, you say "encrypt", well isn't that what is being done now? And you still raise the issue?!?!? Would you not want "private" access to those frequecies also? I am not trying to attack you personally, really. You have good points. If you are the type of person who would use the freq. respondsibly, I commend you. Some would wish the opposite. One last point, perhaps you should get to know a few more officers before you label all as "Nazi"

I am interested in your L4B. Where are you located and how much do you think to ship? How are the capacitors in the power supply?

Overall on a scale of 1-10, what condition is the AMP. I am looking for one to match my B line, but it has to be at least a 9.8 on a scale of 1-10. It took me a long time to get a B line in this condition, and it may take as long for an L4B to match, so that is why I am being picky.

If I wasn't trying to match I would be so picky!!!!

2186. Easy Alinco DJ-S41 and DJ-S11T Mods

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-24 00:00:00 UTC
From: lraymond@sisna.com
Message-ID: <winWeb24Jul97195446@DIALUP6401.SISNA.COM>
Source record: 169541

I own both radios, and I just modified them today
by removing a small resistor/jumper from the boards.
Results:

The DJ-S11T originally TX and RX on only 144-148 MHz.
Now, it receives from 136.000-173.995 MHz.

The DJ-S41 originally TX and RX on only 420-450 MHz.
Now, it receives from 400.000-499.995 MHz.

Both radios also transmit well outside of the given
amateur bands, but using these radios to transmit
outside amateur bands is illegal, as you know.

I found this mod on someone's web site a couple of months
ago, but was afraid to try it until a friend (Jose, you
know who you are) gave me the final push to do it.
I can't seem to find the web site now, but I printed
the mod from the site and will send it to anyone who
is interested.

Matt,

Welcome to the hobby!

I think that the only rig currently available that has HF, 6M, and 2M is the IC-706. There is an earlier version that is now discounted to around the kilobuck range if you can find it, or look on rec.radio.swap for a used one. I'd go for the latest one, though, and get all the fixes.

The other choice is a decent HF rig and transverters, but your budget doesn't leave much wiggle room for that route. I operate on HF with one rig, on 6M with a rig that is HF+6, and on 2 with a nice 2M rig. I've been accumulating this stuff for quite a while, though. I think the 706 is a very good choice for your needs.

Look at the weak signal portions of the VHF bands. They are a lot more fun than the repeaters.

You are wrong James. Many modern DMM's will tell you exactly what the voltage drop across a semiconductor junction using only the voltage produced by the battery in the DMM. They do this by putting a known small current through the junction and measuring the voltage across it.

The use groups offer great opportunity to learn things if one listens. It is a proven biological fact that it is impossible to learn with one's mouth open (even metaphorically).

I suggest that perhaps another NG or different forum all together might be appropriate for dealing with your rage and insecurities.

Hi,

I am interested in getting into Satellite communications and would like to get a good capable radio. I have the following to trade (+ cash) for the right equipment:

1) Toshiba 4850CT Notebook computer. 486/75, Active color screen, 16MB, 28.8 modem, 810MB HD, full docking station with ISA slots. This PC has been used only in a home environment, never mobile! It is in perfect condition. It runs under DOS, Windows (95/NT).

2) Icom 281 50W mobile. 9600bps. Never mobile, less that 2 hour use! Great mobile or base rig. With manual and all other goodies.

3) AEA PK 232 (late model). Paktor and all the other stuff.

Please reply at brumey@ns.net

Thanks

>a quarter wave ground plane rod is 3 dBd, or 5.14 dBi.
>
> Uhhhh, right?

Wrong (and right) Ed,

You're comparing vertical versus horizontal antenna's.
And a directional versus omnidirectional antenna.
So it's apples and juices. But to give some figures:
Dipole(horizontal) versus quarter wave vertical, the latter wins by 3 dB.

If both antenna's are placed vertically, which is the only way to compare
them based on
size in terms of wavelenght, the vertical dipole has a gain of 1.68 dB
over the quarter wave.

The above goes for radiating in free space ONLY, which is useless I'm
afraid.

Back down on earth groundwave reflection , antenna height above the
ground, surroundings (up to several wavelenghts distance)
and ground conducting quality make the work or not. This inhibits gain
figures from roughly -15 up to +20 dB in "normal" comparisons.
There the 3 and 1.68 dB differnce becomes insignificent.

I guess it's better to determine the frequency and reason for communicating
(and needed distance) before
to go for either the dipole or vertical.
Please get back to me if I can be of any assistence.

I have these units listed on eBay AuctionWeb for best access, and most
fair bidding.

The following link will show you all items I presently have listed there
for auction... just click on the link for the item you wish to bid on.

http://www2.ebay.com/aw/seller-list-fast.cgi?email=ron@alphaomegaelectronics.com
(hopefully that all appears on one line!)

If it's not updated yet, use this, and search for "GARMIN" or "GPS" in
the very top box (beta search): http://www2.ebay.com/aw/search.html

(note: check ever couple of days... I'll also be adding my old
engineering prototype GPS-100 Survey unit... it has "long term position
averaging" for MUCH more accurate position calculations. Or, I may sell
it to the first person that comes up with an offer I can't refuse...
like about $500. It's not the best looking unit, but it works great!
I'll add it to my WebSite first, so check it out, use the link below...
in the "New Arrivals" page.)

Thanks!
Ron Chinnery

>I am getting ready to purchase a Kenwood 733a dual band... anyone have
>anything negative to say about this model?

Hi there, It seems to be a good radio. I use it without most of the
bells and whistles. The only complaint is the PL (transmit) level is
much too loud. There is no adjustment for this. I'm told the CPU
generates it and you can't adjust the damn thing (good move Kenwood)
The radio can be sent to Kenwood so they can change resistors and such
to bring it down abit, but it's not worth the money to do this. So
I'm living with it, or the people who listen to me live with it. I
think the problem was fixed somewhat in later production radio's.
Good luck with it, it does do a lot of stuff.

There's nothing wrong with MFJ products. Perhaps "slow learners" would
ruin their equipment no matter who manufactured it.

The voltage comes from the battery in the multitester of course. In the diode test position, the tester reads the voltage drop across the junction caused by supplying current to the device from the tester's internal battery. *Yours* is one of the least knowledgeable posts I've seen this year. Sheesh.

I bought mine in Feb 96. Intermod can be a problem on the 733 in some areas. It was much more of a problem in Colorado Springs, CO (no trees, commercial antennas on TALL mtns) than it is in Atlanta, GA. I was considering a 152MHz notch filter for it until I moved to Atlanta, where the problem has disappeared. In short, if you experience intermod on a wideband HT or on a scanner in your area, you'll likely experience it on the 733a. Aside from the intermod, I've been very pleased with the radio (even for the $500+ I paid)

<01bc9876$85ab7320$9324f326@Doug.paragon-networks.com>...
>Well, Mark, now I need a sanity check.

Hello Doug,
Hope I can clear some here because there's so much difference between
theory and real life.
Let's go to your statement:
>The dipole and monopole calculations for antenna radiation resistance,
>etc.... that I've seen were calculated over a perfect ground. And
>since
>the radiation patterns for both the 1/2 wave dipole and 1/4 wave monopole
>are the same (over the perfect ground, both vertically oriented), the
1/4
>wave
>monopole loses out since half it's radiating pattern is in the image
below
>the ground and the other half up into the air. So, thus the 1/2 wave
>dipole
>is double the 1/4 monopole.

Yup right, in theory again. Because practically you cannot compare
antenna's unless :
- it is (almost) exactly the same theoratical design
- and both have the same polarization
- and both have the same direction/ field angle pattern
- placed on exactly the same spot (environmental surroundings)
- in free space (which is only effective for discussing gain and radiation
patterns)
- we forget about the radiating resistance and any necessary equipment for
matching to the source
- it is determined wether to discuss field strenght locally, performance
till horizon or worldwide communication
- if all the above cannot be matched, then it's the succes of the
communication only which counts.

In real life we have to consider the reason for communicating; distance ,
frequency, local environment, ground specs and many more
before choosing one antenna above the other. That's why I reject comparing
any antenna with the other unless there's been some
debating first.
But that was not your point I'm sure. The difference you gave where the
1/4 wave loses some because it can radiate only in the "upper"

1/2 wave above the ground (because the other is the image below) indeed can involve a loss. This both in local field strenght and communication beyond the horizon. This is true in all cases if the 1/2 wave antenna is placed vertical. And there's more than the 1.68 dB difference noticable in practice due
to the lower take off angle etc. You are perfectly right here.
I was a bit pending on the situation were the dipole is placed horizontally firstly, 'cause that is more common.
In that case we can consider lots of new parameters before comparing, since then many different situations in terms of performance occur.
This has fascinated me for many years now. I 've been building lots of different variations in many practical situations and can only predict reasonable performance figures in terms of communication only. The help of any antenna-analysing computer program (based on MINI-NEC f.e.)
is interesting for theoratical interpreting the model and is surely helpfull. I can recommend some if you need.

>And even if they were both oriented horizontal, the 1/2 wave dipole is
>still
>double the 1/4 monopole? Need help with this one, please.

Eeuhm... the 1/4 placed horizontally doesn't work in any respect I'm afraid.

>
>Could anyone shed some light on what they may be used for?
>
>Please reply to csc@smartt.com if you have any info.
According to my old equivalents book,CV2271 & GC10B are
equivalents.Also lists Z303C (Mullard). In fact for GC10 it reads
"GC10B/S (Eric) " which is from the days when Ericsson made
tubes. Tube type is shown as "C" meaning "Counter Tube"
rather than magic eye; a magic eye would have been "TI"
which is tuning Indicator.
Hope this little bit helps...
Chris Muriel (G3ZDM).

Motorola CP-50 for sale / swap. I am traveling more now, and I would like to get a duo-band handheld, and sell this handheld. The handheld covers 136 - 174 Mhz, and is 5 watt, with a front panel selectable 1 watt for low power. Front panel programmable! s-meter / scan / power saver / and more! The radio has independent PL / DPL selection for each channel.
Like new, low hours, used as a travel radio.
With battery, manual, rapid charger
$350 or swap for FT-51 (if yours is like new).
I would also entertain other types of handhelds, if they are true duo-band radios (receive both bands at the same time)

I will post the mods when I get back from vacation. I have to so some editing to remove the "source" of my info. He/she could get in a lot of trouble from Icom if they find out. This is my same source who told me about the Icom 706 MK ii coming out about a year ago.
There are two mods:
Mod 1 gives you transmit from 1.6 to 200 MHZ complete and involves removing three diodes. It works. The problem is If you transmit around in the 73 MHZ to 93 MHZ ? it could cause some self-occilation and blow the finals (according to Icom). I tried this to test if the radio could work on the British 4 1/2 meter band and it works great.

Mod 2 gives transmit from 1.6 to 60 MHZ and 135 to 175 MHZ.
It involves removing 3 diodes also. Just as easy. You can see the mods a week from now. If you hack up the radio I am not responsible.

>by tleco tomorrow....I also want to add that
> 73s DE WA1YKL

I found a bug in the FT-50 that sounds to me like the same problem.
How do I communicate this with Yaesu?

If I set two different memory locations to the same frequency with
different squelch tones and then try to memory scan both channels.
Very often (> 50%) of the time either correct PL will NOT open the
squelch. It seems if it hits the correct channel first it gets
through, but if it it hits the other first the squelch will never open
& it will just keep scanning & scanning & scanning & scanning....
right over the correct channel each pass. Even though We are still
transmiting from a second HT on the proper freq. & with the proper
squelch.

I'd say that this alone proves him fairly dim - most
likely he powered it up into a horrible mismatch
(open at connector?), blew the devices, and has
spent the rest of his energy trying to get a free
replacement. Why take something apart BEFORE you

try it out?

I now see that the Icom 2000H is wide band receive: 118 MHZ aircraft to
175 MHZ which is a big window for intermod. However, the advertisment
says "INTERMOD RESISTENT"..HMMMMMM?
BTW the WHOLE 2 mtr ham band gets "destroyed" for 1/2 mile of any
radio towers etc. The radio can't stand up to any of the less expensive
2 meter radios on the market! If ICOM can't correct the problem I will
suggest to the Newsgroup that everyone Not buy this radio and perhaps
buy the ADI brand which had the best Intermod rejection or the Radio
Shack 2 meter radio. These two radios plus the Yaesu FT-2500 have 3
stage track tuning which enables WIDE Band recieve but with no intermod.
I feel like I was tricked in the advertising "INTERMOD RESISTENT".
The radio will be sent to Icom the beginning of the next week and I will
be anxious to see what happens. Perhaps a component failed which is
causing this problem. I don't recall getting whipped out by intermod
for the first 1 1/2 months I owned the radio.

ICOM should not say a radio is Intermod resistent if it isn't just to
make sales. I should have been wary after seeing that the radio has
wideband recieve 118 MHZ to 175 MHZ. I suggest Icom have two versions
of this radio. One version with a TIGHT FRONT END labled ICOM 2000H TFE
which is deaf outside the USA 2 mtr band.

2225. VX-1R Full RX, Expanded TX Mod

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-25 00:00:00 UTC
From: jcwren@atlanta.com
Message-ID: <33f2a273.251550460@nntp.atlanta.com>
Source record: 169414

This is the basic VX-1R mod. I've taken what I've found on the net, and expanded on it slightly, after performing the mod to my radio.

Note that after performing the mod, ARS (Automatic Repeater Offset) will not function (whether it's turned on or not), and you will lose any stored memories and preferences.

The mod is very simple. First, put the piece of protective plastic back on the display, or take a 3M Post-It Note (tm), and stick it to the display. Work on top of a piece of 8 1/2 X 11 paper (good contrast, will also keep from marring the radio).

Open the radio by removing the 3 screws. Taking a small flat screwdriver, release the tab on the left, inside the battery compartment (assume radio is facing down, antenna away from you). Release the 2nd tab that's about halfway up the inside of the battery compartment. Being very careful, separate the 2 halves the radio. You'll need to apply a kind of rotation along with the separation. Note that the battery compartment lid and hinge pin will fall out. Keep track of these!

Immediately to the left of the rotary knob and next to the edge of the case, you'll see two pads, marked 0 (closer to the top) and 1 (below 0). They look like a gold circle with a line down the middle. You won't have to move the battery compartment sticker to see these. Each of these pads need to be bridged with a solder blod. Use a small iron, and work carefully, or you'll burn the case.

After bridging the pads, snap the radio back together. I had a slight amount of difficulty getting the right side of the case aligned, so you may have to work at it slightly. Before you actually perform the "snap", put the hinge pin through the battery compartment lid, and reinstalled the lid. Replace the 3 screws.

Add battery, antenna back to radio. Holding the M/V key and AR, apply power (this is the hard reset to the radio). When the menu that says "INI? F" appears, press the F/W key to reset the radio. You should now have the expanded mod. You will lose all the memories and preferences, so either record them, or do the mod before you save lots of frequencies.

My tests show that you can also now transmit from 108 to 137 (AIR), 137 to 170 (V-HAM), 170 to 222 (VHF-TV), 420 to 470 (U-HAM), and 470 to 580 (part of UHF-TV). I haven't measured power output, but am simply going on the fact of the TX LED lighting or not, and whether

it made the speakers next to my PC buzz or not. Remember, it's not nice OR legal to transmit out of band, or outside your license class.

When tuning around, be sure to check the receive mode. The processor puts the radio into AM in places where it doesn't make any sense, so don't trust the RX-MODE option being in AUTO. I keep mine disabled.

I do not represent Yaesu, and cannot be responsible for improper use or performance of the radio after the mod (standard disclaimer BS, you all know that...)

Source record: 169415

Hi Chris,
I have had my Alinco DR-610T for a few months. Its a real great machine. A couple of weeks ago my backlight on the left side started blinking. Finally, a couple of days later it went out completely. The thing I wanted to do before it went belly up was to see if the built-in programmable dimmer would work. I never got the chance. For the moment the right side is still working ok.

The machine has a 1 year warranty. It seems crazy to send something back to the factory just to have a $1.00 bulb changed. Of course it will be cheaper for me to send my radio back because the factory which is in Torrance California is only 130 miles away.

This is for Alinco dealers and factory representatives, you have a problem here. I hope you have a fix before you get a bad name out here in the real world. Don't be like some other companies (the big "K" and the big "Y") and wait until customers complain before fixing your equipment. Take the bull by the horns and do it now.

Rubin
DR-610T owner with Plus 120 channel option and Tone Decoder option.

The DPL mode also does not mute the squelch. And oddly enough, the VX-1R
and the FT50 both sent DCS turn-off codes at the end of transmissions.
If they would go to that much trouble, which is real nice, why not
arrange the decode function properly?

Hello tnx for reading this message.

a few day ago I bought an antenna FD3, it's a wire antenna from abt 20M

Now i have 2 possibilities to install it.
1. in one line from north to south on about 8m
2. in north - south east with the balun on 12m but as inverted V

what's the best way to do it...?

tnx in advance

Not really sure...I'll check my data files...

> Also trying to figure out what the difference is between a UHF and a
> VHF 5C ICOM. They have the same part number but a different suffix.
> The real question is can I use a VHF 5C ICOM in a UHF receiver ?

Yes, you can use a 5C ICOM anywhere....the temp comp will NOT
kick in until the temperature hits the high or low end of the design.
At normal room temp, it will act only on the xtal and its tolerance
(plus the tolerance of the compnents...caps, etc)....but it will
not be 5ppm if the temp comp ckt kicks in....but I doubt you will
notice the difference...the ICOMs are untuned so a RX ICOM could be
used in TX and vice versa...but remember they wont perform to spec if
the temperature gets too hot or too cold.

Subject pretty much says it. Has anyone used this antenna? How is its performance, relative to other "real" base station verticals from Comet, Diamond, Cushcraft, Hustler? Any opinions would be appreciated.

2243. FS: Tower climbing belts

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-25 00:00:00 UTC
From: RJA <k1cc@mindspring.com>
Message-ID: <33D94337.DFEE6721@mindspring.com>
Source record: 169432
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

I have the following safety belts for sale, all are unused and made by Miller Equipment, a top-quality supplier of fall protection equipment. Quantities are limited, so it's first-come first-serve. When sizing a belt, keep in mind that you will probably be wearing some warm clothing, so it's best to go a little bigger than smaller. Add $7 per order for UPS shipping.

1) Body belt with saddle, (2) "D" rings on both the waist belt and the seat belt. This is the ultimate in tower climbing belts, allows you to use the secondary belt as a saddle when you're in place to save your legs. $50 (Small, Large, no Medium)

2) Body belt with saddle, (2) "D" rings on just the waist belt. This is similar to the above, except that only the waist belt has "D" rings, but still allows you to transfer some weight to your rear end to save your legs. $45 (Small, XL, no Medium or Large)

3) Body belt with (2) "D" rings (Small only). SOLD OUT

4) Tree trimmer belt, (2) "D" rings on the saddle but not on the belt, 3" back pad. (Small, Large, no Medium). $50

5) Body belt with single "D" ring, twist-lock snap hook attached to "D" ring allows a lot of flexibility in motion (such as in construction work). removable 3" back pad. $20 (S, M, L)

6) Body belt, no "D" rings. Use with a lanyard (see below) for bucket work, ladder climbing, roofing work, etc. $10 (S, M, L, XL)

7) Single-snap webbing lanyards, use with the body belt above. Snap on one end, loop on the other end. 8000 lb tensile strength, great as an extra safety strap for tower climbing, lift or securing heavy items, pulling your truck out of the mud, etc. $10 for single-snap, $15 for single-snap with shock absorber.

8) Body belt (made by Rose, model #502522), two straps attached to waist belt with snap hooks on each end (one size fits all). $15.

9) Shoulder harness, adjustable shoulder straps, double ply waist strap, single "D" ring on back. $30 (Large only)

10) Full body harness, (2) shoulder "D" rings and (1) back "D" ring. (Small only). $45

11) Full body harness with (2) shoulder "D" rings (Small only). $45

12) Full body harness with (1) back "D" ring. (S, M, L). $45

13) Tool pouch with loops to attach to any belt. $7

73 and safe climbing!

If we all have to rely on the timely and accurate reporting of the media,
then we're all in trouble. I don't mind if the public listens in to our normal duties
and the "special ops" activity is was on different channels. As they say...moot since we've
gone digital. But I do miss dispatch sounding sweet and sexy instead of Robby the Robot.

BTW, if the press has access, so should the public...like there are no leaks from
the ultra liberal reporting staff.

I believe you'll find that the STBR432 was/is the FAA solid-state version of the 4B32. When I was working NAVAIDS, they came out in about 1970-something. They always seemed to work. Only thing is, you can't see the color change with load or when they've gone south! Jeep - K3HVG

Patrick, what makes you think you cannot listen to the military.
I do it all the time. We share some of our bands with the military. If
mil ops want security they use encrypition or some other secure
technique just like our county sherrif department. They have a trunked
system with digital encryption. I repaired an old trunked radio I got at
a hamfest for $10 and had it programmed so I could monitor them, not
because i felt i must hear, but as an exercise in technology.

Terms are as follows:

All items are for sale AS-IS, all sales FINAL. Please feel free to make an
alternative offer. I reserve the right to decline any offer.
Payment is prepay (personal cheque OK) or COD by certified funds.

For more information, contact: Christopher Edmonds - edmondsc@fiu.edu
================================================================================
Motorola Radios & Accessories (see below for more info)

$400 shipped for the lot

qty 1 HT50 154.6 MHz
qty 4 HT90 154.6 MHz
qty 3 HT90 154.57 MHz
qty 1 HT50 154.6 MHz (spkr & mic missing from faceplate)
qty 1 HT50 154.6 MHz (top is cracked up, spkr but no mic)
qty 1 HT90 154.6 MHz (spkr & mic missing from faceplate)
qty 2 HT90 shells (body only, no faceplate) one new
in plastic, one used

qty 1 NTN4864B charger
qty 6 NLN7646A charger
qty 6 NTN4864A charger

qty 14 NLN7434A & similar batteries
qty 1 NTN5453A battery

qty 13 BNC whip antennas various lengths
qty 1 HT50 screw in antenna

I would like to sell all this together if possible. The chargers are in
decent cosmetic shape, some have marker writing on the front. The radios
are somewhat more beat up. All of the radios were used for data
transmission, all have had the accessory jack removed. Some have a short
coiled cord with a strange connector in place of the jack, some have
nothing at all here. I have tried most of them, however, and they all
seem to function anyway. The condition of most of the batteries is
unknown; I charged up a few to test the radios, that's it. Because of
the condition of this equipment, I offer no guarantees on it.

Hi, did you install the two solder jumpers to initiate the wideband
rx/tx operation? If not you may have to do this, then resrt the radio.
If you aleady did the jumper mods, then recheck them, maybe a stray ball
of solder fell into the radio somewhere

Well when the warranty is out, repairs are generally charged for and
this looks like the case here.

If the display was in trouble, and it came back to you in that
condition would you have not questioned why it was not fixed ?
OR insisted the display be repaired under at no charge to you because
they ignored the condition of it and returned it un repaired, quite
possibly rendering the radio un useable.

ICOM, as the other manufacturers do, attempt to bring a radio back
to original factory specifications as close as possible.

As a service customer you should EXPECT and insist upon that type of
service.

You had ample opportunity to list repair pricing not to exceed or
other special instructions in the note that is included with the radio
when sent in for repair. You could have said call me if the repair is
going to be over $ 100.00 and you would have been called.

If unsure, on ICOM's web site www.icomamerica.com there is an entire
list of information about how to handle your request for service when
sending in a product for repair. It is under getting in touch with
ICOM. ICOM even has labor rates and warranty information posted
there.

Most any service organization does not have time to call and ask for permission to install a transistor, screw, sticker or display nor do so. Parts and labor can be expensive for radios as with other consumer electronics..

Sounds like ICOM did what you asked and repaired your radio.
They repaired what they found in trouble was in trouble and returned the radio you.

No sour grapes here, you just were not specific with your instructions.

Hi, I still have not heard from Yaesu directly as to if they might have
any ECOs that might cure this condition; I suspect it might be solved by
speeding up the response timing of the squelch and/or CTCSS decoding.
I'll pound on them some more by tleco tomorrow....I also want to add
that I did confirm yet another bug that was reported here, in that if
when receiving a signal where you have the CTCSS decoder mode active
and the CTCSS tone goes away, as can happen as part of the squelch tail
eliminator system used by Motorola and others, the VX-1 will NOT mute
out it's audio, untill the carrier itself gors away. I checked this by
putting a signal with a CTCSS into the VX from a Service Monitor. Then I
switched OFF the CTCSS tone on the SM. The VX-1's speaker continued to
stay open. I have never seen this before in any radio that uses CTCSS. I

have not tried this same experiment yet using DCS(DPL). Considering that DCS has a special "end of transmission" code sequence that is supposed to force the audio to mute, it might not be a problem there... As long as you have the VX-1's squelch set to some value greater than 3, I don't see this condition as being too much of a show stopper, but it is annoying.

On a related topic, I hope with the ADMS-1D, you will be able to program in CTCSS tones on UHF-T band freqs.

>
>Lee

You duplicated 1/2 of the OPC-599, made the 7 pin din female.

What I ran into was when using the tune button the antenna relay would drop out leaving the tuner out of circuit. I was unable to get to a correct tune when I pressed the tune button. Others also ran into the same trouble. Merely talking on the mic would cause the tune light to start flashing and I would talk the tuner off the air. The tuner then was not engaged when the red tune lamp was out.

The solution for correct operation I found was setting the internal switch within the AT-160 in the down position and ignoring the tune switch, I was able to achieve the prefect tune when using a carrier mode like RTTY when I just keyed the microphone. The AT-160 will follow you around as you change bands. The band switching voltage coming from the ACC port tells the tuner what band the 706 is tuned to. So by using the OPC-599 the whole thing is merely plug an go. The tuner picks its power from the 4 pin connector and the band switching voltage for the Din cable. Also the tuner feeds back an ALC voltage dropping the 706 output to some 8 to 10 watts during the tuning process.

Have access to many and tested 5 - AT-160 s and found the same results each time.

Try placing the 706 into RTTY and give the mic a short key down. The tuner should react and tune, likewise if you have the cover off you should see the cap changing position for each band you dial up. Many times this change will be quite drastic like over 1/2 turn. This is the tuner setting up in the preset condition. Once RF is applied the tuner does the fine tune job and your set to go.

Best Regards,

Gary Fiber KF7XV

I myself was really tempted to buy a used MFJ 20m CW xcvr. I had heard favourable comments about them and am a happy MFJ owner (a tuner and a 1278 TNC)

However, for a few dollars more (albeit twice the price of the MFJ), I acquired a used Index Labs QRP Plus.

I feel that, for the extra money, I got a whole lot of added value - SSB in addition to CW, all ham bands instead of just one, general coverage receive, digital frequency readout, frequency memories, a beautiful switched capacitor audio filter and built in keyer...

While the QRP Plus may be hard to find, check out the SGC 2020 at SGC's web page. It's designed by the same guy who manufactured the QRP Plus. And it solves the power dilemna by giving you a whopping 20 watts !

Have you made a list of the various frequencies that are causing you
troubles in your area? The " intermod " problem might be an image
problem from caused by the many transmitters in your locality. One
form of an image is if a signal is on a frequency above or below the
radios tuned frequency by one or two times the value of the radios IF
frequency. This generally will cause a direct shot into the radio.
Find out what frequency is causing the problem so ICOM might be able
to assist you here.

They can not do a thing if you can not provide basic information about
which frequencies are causing the troubles to you.

Also if you do not have a good handle on this you might consult the
Radio Amateurs Handbook an explanation of Images and how they relate
to radio.

Hi, I've got for sale on Ebay's Auction Web:
Antique Tube Radio, Lafayette, Pre WW II. The outside case is basically shot. It has the face plate marked with Lafayette and has 2 swastikas, which is what leads me to believe that it is pre- WW II. It has a plate affixed to the back of the chassis marked G7417, which I believe is a serial number. It has 5 vacum tubes, they are marked as follows:
2 are 35-51, 47, 24A, 80. I think that each number should be preceeded by a " G ". All the tubes are Wards Super Airline except the 80 which is Nat. Union Electic. The unit will power up and all the tubes glow. I ran it for 5 mins. It didn't catch fire, smoke, or smell, also it didn't produce any sound. The original case is a round top (cathedral type?). Buyer pays 18 lbs. S&H, Please e-mail me with your zip code for acutal shipping cost.

Check out the Kenwood FTP site ftp.kenwood.net and the amateur radio application notes and service bulletins.

Both of these are discussed - aan-0020 covers the remote control issue aan-0021 covers the HOT mic issue

0020 does not tell the whole story as remote repeat set their way is a one way repeat, but cross-band repeat does work. Can't recall setails but if you comapre the instructions in this and also the 'repeater' mode of your manual you will see the simularities.

0021 this problem has been known about for a VERY LONG TIME (see aan-0003!) and the fix is relatively easy - so why does it still occur.

My BIG TWO wishes are

1. Auto mute of alternate channel. Enable the user to have automatic muting and/or attenuation of the non-primary channel when a call comes in on the primary channel.

2. When set in 'one reciver mode' (blank alternate display whatever) the ability to chanage from one band to the other still using the band change buttons - not change to dual band mode - change bands, back to single band mode.

A GREAT RADIO, and I really like it.

To use the radio for monitoring privately you can use an ordinary stereo earphone set. The audio will be heard in only one of the earphones. If you want to monitor on the ham bands you must lock the PTT or the tx will key when you push in the plug. Unfortunately you can't transmit while using the earphone. For that I await further mod info on this newsgroup.

I used some old earbuds and cut off one of them making it very handy to monitor while walking around with the unit on my belt. So far I haven't noticed any damage using this setup but of course you do this at your own risk.....

2280. ICOM W32A peculiarities

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-26 00:00:00 UTC
From: Ernest Stracener <ernest@itis.com>
Message-ID: <33DA08AC.44AF@itis.com>
Source record: 169296

RE: the ICOM W32A.....can anyone else verify the following? How about on a radio without the extended rx (pre mod)?

(snipped from private message)
I've noticed something peculiar about the radio, however. When I have the weather channel on and a 144 band
frequency on the other "side" of the radio, I cannot transmit on 144 for more than 1 second. If I switch off of the weather band to anything else, I can transmit; if I change 144 to 440 I can transmit, but in the configuration described, 144 does not transmit when the weather channel is on the other side. Peculiar. Also, which bands show up on which "side" of your radio post-mod? For me the VHF band -- weather, 144 vfo, air vfo, 440 vfo; on the UHF band -- 144 vfo, 300 vfo, 440 vfo, 800 vfo. The programing software appears to suggest that 300 should show up on both the UHF and VHF bands of the radio. None of this causes any problems, just makes me curious.
(snipped from private message)

Thanks to all that respond. Also....I'd like to locate some IC-W32A users in each state that have or are using the programming software. It would be very simple and very advantageous to traveling hams to have a repository of programming files for each state (or region of states where more than 200 repeaters are present, combined, 144 & 440) on a single web site. That way, we can "divide and conquer"...avoiding the painstaking work of programming all of the frequencies in on our own. I've almost got all of WI programmed into the radio's memories.....I've got the web space....any takers on the project? E-mail me privately......ernest@itis.com

Do any IC-W32A users have any comments/complaints on the HT's audio quality? I am kind of dissapointed with the audio quality, but I have nothing to compare it to.....(yup, I'm another no-code tech....oooooh!).....

The best thing to do is write instructions to Icom as to a price limit or to repair "ONLY this problem etc". The repair tech is not a mind reader. However, the Radio brand new costs $270 including shipping and the repair was over $130. Once the repair gets to 1/2 the cost of a new unit the repair tech should think twice. I will send my IC-2000H in to get the intermod problem looked at under warranty. I will post my experience with their service dept.

yeah, when I made the phone call [1-800 number], I got a sense of
image of the evil eyes and mouths. I ordered a battery pack
which costed me only $20 total. It seemed that they didn't want to
place the order and ignore since they wouldn't make much profits from
my order.

Steve:

You must be having a bad day. Unless it is the 2 meter band, the 706
will put out 100-110 watts without hesitation all day long. If you are
using a "Bird 43" guess what, it isn't peak reading! just the average.
30-40 watts is typicall on Amateur HF 100W rigs. What do you get in FM
or CW? I'll bet 100W. +

If not, I apologize. I have worked on a couple of 706's, and for the
size and performance, it is a amazing radio. I work on all Manuf.
equipment. They all have shinning glories and embarasements. The 706 is
one of the glories.

2286. WTB: data telemetry gear; need suggestions

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-26 00:00:00 UTC
From: harry@connix.com
Message-ID: <33da059a.4375215@news.caps.maine.edu>
Source record: 169349

Hi and thx for reading.

I have a project on Cadillac Mountain in Acadia National Park that uses 2 data loggers to record several environmental parameters related to a range limit study of certain pine tree species. I am interested in the possibility of being able to download datasets by radio, especially in winter when the 2+ mile hike-in could be treacherous.

The data loggers (Campbell CR10's) are compatible with modems, etc. If anyone is familiar with a good reference book on the subject, has gear for sale, has gear recommendations, etc., please send a note.

Thanks & 73

Looking for information from the operations manual and/or experienced users
of the HP 163X series of logic analyzers.

1.The catalog pages saythat I can do a screen
dump into a HP 2225A ThinkJet. Does this just capture the screen or does it
also have the capability to print out longer lists of captured states, which
may take up several screens of data?

2.Also, do you know of any economical (< $500) hardware / software soultions
of capturing state and timing information and bringing it into a PC? I know
I can buy GPIB boards, but I don't want to write the software myself.

3. Also looking to buy a copy of the owner's manual and a copy of service
manual for HP 8082A pulse generator.

Reference, an erlier message in this newsgroup re: When a memory channel has been programmed with a frequency (from say, the VHF HAM band) and you want to overwrite it with another frequency (from say, the UHF HAM band) an error occurs and it won't overwrite.
I had this same problem. I called Yaesu tech support and they seemed to be unaware of the problem. However, the tech support person called back within a half hour and said that he had indeed encountered the bug.....BUT only, it seems, with ODD numbered channels. He said that he had tested out the bug and found that he could overwrite many of the EVEN numbered channels, but admittedly NOT the ODD numbered ones.....Boy, that is ODD!!!! (pun intended).
Another problem? Some of you may have noticed that the TONE SELECT and SQUELCH TYPE don't work on the UHF TV and ACTION 1 BANDS. Where I live, several police departments use the 470 MHz part of that (UHF TV) band. Because the area is congested use of the CTCSS Encode/Decode is almost a necessity. Kind of silly for Yaesu to have left that off this otherwise great little radio.

I need help with the value of the following equipment. The person selling the equipment says he'll negotiate a price with me, but I need a ballpark of where to start bidding.

Package includes:

* Kenwood TS-520s
* SP-520 speaker
* AT-200 Antenna Tuner
* VFO 520s
* PC-1 phone patch
* MC-50 desk mic
* Homebrew digital display - simuliar to the DG-5
* All need cables, manuals, and a service manual

I know this is older equipment, somewhere around 1978 vintage, all solid state except the finals are tubes. I am looking for a beginner rig and this model seems to be raved for its ability, or so I have read. I would appreciate any comments and appraisels of the equipment.

Thanks,
Les

I had this problem too, and it was because I had my com-port set wrong on
my software and PC. I know you said it worked well with other rigs, but
after a few tries, it ended up working. On occassion, I have to abort,
turn off rig, and then re-start from scratch.

Steve,

Removing the third diode causes the PA to oscillate an will likely
cause damage to the PA section.

ONLY two diodes are to be removed. removing the third diode will void
any warranty.

> 73's Steven Hershman NS1R

Steve,

Take my advice here READ the second paragraph and Before you send
your radio take some time to see if you can provide some frequencies
that are causing you the problem. If you can not do that, ICOM will
have no way of simulation of your complaint. ICOM needs to know what
frequency the radio is tuned to along with what frequency is causing
you problems. example when the radio is tuned to 146.520 the
frequency of 156.800 is causing me problems. With out this
information there is not much if anything they can do. Just stating
the radio has problems with intermod does not tell the tech a thing.

Operational transmitters are not the same in every city.

ICOM has tried a number of radios in Seattle's " intermod ally "
which is atop of Queen Anne Hill where all the broadcast towers are.
The 2000H radio works great there, no problems at all.

ICOM knows if a rig works at Queen Anne Hill it likely will work in
other parts of the country.

Simulation of these complaints are not easy as many signal generators
can not even come close to producing the same level of signal as an
operational transmitter can.

Keith:
About that part saying that "part of the power is dissipated into the
ground." Remember, I'm defining this as an ideal ground plane. That is,
extending infinitely, perfectly smooth, and, perfectly conductive. Now,
if it is "perfectly conductive", it has zero ohms per unit length. And
then, how does the power dissipate traversing zero resistance?
IIRC, the explanation of the virtual image is obtained from the flow of
the current through the ground plane. But let's not get into that one
till we figure out what's going on above ground. ;)

Hi there all,
I bought a yaesu ft-50 RD 2 months ago and yesterday I dropped it in the toilet bowl!!!!
Don't ask how I did it but there it was at the bottom of the bowl.
I quickly removed the battery pack and with an hair dryer,dryed it out for 15 min.
Gess what??Put a fresh pack on it and fired it up.My baby was going like it was before.Yep!Gess it is a tough little dual bander.

Hi Gang!

I'd like to take a minute to invite you to stop into the Central Michigan Amateur Radio Club's Web Site, as well as the KB8TNQ Ultimate Amateur Radio Page! as soon as you can.

The first Site, CMARC's, is located at: http://www.kb8uyz.com/cmarc and offers information about our club. Additionally, and perhaps our biggest addition to the Site, (The "Trader's Page") offers FREE SPACE for you to post your items for sale. The guidelines are posted, so check it out.

The second, KB8TNQ's Page, is located at: http://www.kb8uyz.com/kb8tnq and is a great source for those in the hobby and those who are looking to get into Amateur Radio. With links to many other great sites, you'll have to stop in to check it out.

Thanks for your time and be sure you leave your comments and URL in the guestbooks, as we're always looking to add new ones.

7-3,
Jim KB8TNQ

With this unit only having a AA battery cast which is only 19.95 the charger is only good if you have rechargeable battery's. A new FNB-41 is 58.95 which comes w/ unit for 5 watts. This price reflects that it is cheaper to buy a new one. It's to bad this guy got taken for a ride.

My experience with AES has always been good. They seem to be one of very few stores that care if you are happy with the equipment you receive and with your purchase in general. I was unhappy with an Icom IC-T7A, had a slight problem with the scan feature, and they agreed to give me full credit on an IC-W32A.

When you order something they will tell you if it is in stock, and ship it that or the next day. I usually get two day service from Milwaukee to Nebraska. If its not in stock at one store they will check their other stores, on computer, and ship it from there. I have delt with several salesmen from different stores and they all seem to be friendly and helpful. The only store I have walked into is the Las Vegas store, and everyone was friendly and helpfull.

This is the second 706 the first one had the same problem so did the demo at HRO in burbank.I called ICOM on the phone and told him my problem he said icom is not like kenwood our radio dont put out a full 100 watts that the best I could hope for is about 50 watts but they have a mod to up the audio level to send it in. They changed a cap and resistor and sent it back to me. Well there is a little more power but not the 100 watts on SSB . So I sent it back and they checked it and on the service work order the tech his name is DAN wrote "Wattmeter reading good @ 30 watts on voice peaks" . Yes the radio puts out 100 watts on all other modes 40 on AM. What can I say. As to a bad day it's more like a bad year and a half every time I think about the $1250.00 I wasted. I'm sure the day will come when I smash the piece of shit. I think i'll go back to my first hobby which is large caliber handguns.

Yeah, that "toughness" is one reason I bought the FT50 while already owning an FT-51; I spend a lot of time hiking, and really wanted a radio that could handle a little moisture exposure.

I once dropped an HT in a chemical toilet; the outcome was not so pleasant as your result!

2320. Here it is! Extended transmit mod for the ICOM 706 MKII

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-26 00:00:00 UTC
From: Len - KC2ADV <lenny@handy-man.com>
Message-ID: <01bc9a1b$d80a9d20$227ca49f@tunls-home.nabisco.com>
Source record: 169383

Extended transmit mod for the ICOM 706 MKII

This file may be freely distributed as long as it remains intact, with no modifications, additions, or deletions.

DISCLAIMER:
I assume no responsibility for damage or inaccuracies contained in this document. In other words, USE THIS AT YOUR OWN RISK. It worked for me, however I don't know if it will work for you.

WARNING #1: This mod requires the ability to remove surface mount diodes. Only those who are qualified to do this should attempt this mod.

WARNING #2: This mod seems to erase all memory channels, etc. You may want to save this info for reprogramming.

Disassembly:
1. Face the front of the radio towards you.
2. Remove the three screws in a row across the middle of the top of the radio.
3. Remove the two screws at the top rear (on the sides) of the radio.
4. Pry the top cover off from the back.
5. Disconnect the speaker at the connector.

Modification:
6. Near the top rear of the main circuit board, there is an small, oblong metal can. Directly below the right side of this can is two surface mount diodes with a white silk-screened box around them. There is also what appears to be a circuit board part number just to the left of it (mine says B4916D). Remove the LEFT diode in the box.
7. To the left of this, there is a test point marked CP3. Just to the left and above this test point is another box with two *vertically* mounted surface-mount diodes (Note: there is also a place for 5 more *horizontally* mounted diodes, with 3 installed). Remove the LEFT vertically oriented diode.

Reassembly:
8. Reconnect the speaker.
9. Put the top cover back on. Insert the top cover tabs into the slots and lower into position.
10. Replace all of the screws.

My radio did not require a reset, however I did lose all of my channel memories. It seems to be able to transmit everywhere except below .5 Mhz. I have not tested the power output at all frequencies yet.

I hope this helps everyone who have been waiting patiently for this mod.

Any comments can be directed to me:

Hello
I am new to Ham radio, and for my first radio purchase I chose the Yaesu FT-50RD. This decision was mainly based on the seemingly large number of features that it provided and the large bandwidth. I, being new, would appreciate any insight that fellow owners may be able to offer as to features or abilities that this radio may have that are not presented in the owners manual, but do exist. Please contact me here or through my e-mail at "frenz.3@osu.edu". Any information, insight, or just chat would be appreciated.

Thanks
Dave

Basically, the radio gets wiped out on the entire two meter band. You get FULL S-Meter signal strength throughout the two meter band. You can't hear any repeaters. I have to disconnect the antenna from the radio to hear the repeater. I compared a Alinco DR-570T, Kenwood 241a, HTX-212, ADI 2 meter moble radio.... side by side and they have almost perfect signals in all the Harsh intermod environments in the greater Boston area. This is basically 4 areas. My IC-2000H is useless. I have to either wait till I'm 1/2 mile away from the intermod to have a conversation or take the antenna out of the radio to hear the different repeaters. There has to be something wrong with the radio.

Use copper braid and hope like heck you don't lift a trace up.
Buy a cheap butane (Buffalo Tools-5 bucks) torch and hope against the
above with the addition of hoping you don't remove other surface mounts.
Spend big dollars on a specialized hot air device.

or...

Find some old boards and pratice!
Use some liquid flux to help speed up the flow when using braid.
Dental picks work great for one leg at a time removals.
Beware the glue when done with all the pins.
Well spaced pins and/or componets with cheaply done solder process-
use the braid and gently lift.
Postage stamp IC's with very narrow spaces and excellent solder dip
process- use hot air or torch.
Use tweezers (various types but use what is comfortable to your grip)
to grasp a cap or resistor surface mount and go back and forth with
a soldering tip untill you can lift it up with a gentle pull.
The above will obviously leave solder behind so when you install a new
cap or resistor in it's place just pin it down with the tweezers and
reverse the process.(removing the old solder is a waste of time)
Practice makes perfect.
Gene (15 years as a consumer products technician,CD's,VCR's,Camcorders,
CB's,Audio stuff Home and Car, I've seen it all in surface mounts, and
screwed up many (hardknocks). Every part is unique and requires that
special handling and/or technique to remove it - there is no single
proper way to answer what is the correct way)

2330. HELP with Knwd IF-232c

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-26 00:00:00 UTC
From: B1BLancer <b1blancr@bellsouth.net>
Message-ID: <33DA8D74.CDF@bellsouth.net>
Source record: 169393

I just got an IF-232C for use with my 450S, but there seems to be a communications problem between my computer and the IF-232C. I have the unit hooked up to a 9 pin serial port. The cable is a 9 to 25 pin Belkin serial cable.

The computer is a Toshiba Pentium100 laptop running Windows 95.

I have verified that the port is working properly. A TNC plugged into the same port works just fine.

Anybody have any ideas? What baud rate is the IF-232C supposed to work at? The little owners manual doesn't offer a clue. What about the stop bits 'n such?

Is there a menu option on the 450S itself that needs to be turned on? The manual for the radio doesn't mention it if there is.

Like I said, HELLLLLP!!! Any suggestions would be appreciated. Please send a copy of your replies to my e-mail address, as my newsreader sometimes misses picking up posts, and I don't want to miss any replies.

73 and God Bless,

W4HPW

Just discovered what may or may not be a problem with my Kenwood TS-711A 2M transceiver. I don't recall the last time I ever saw the cooling fan run! Should the fan be running all the time or is it thermostatically controlled?
I don't do an awfull lot of transmitting which prevents the unit from getting very warm -- maybe that's why it isn't coming on.
If you've got a 711 -- would you mind taking a look at the cooling fan the next time you've got the rig up and running?
Thanks, KE4WIS

Cathi:

Moving the antenna would certainly help, but more important, what kind of ground system do you have? You should have at the very least a 6ft ground rod with at least 14 awg wire running to the back of the radio and amp. Cold water pipes in old homes can be poor sources for a ground.

If your using cheap coax you should throw it away and get a good brand of high shield cable. Belden 9913 I think is the number. Your not going to run 1000 watts through cheap radio shack cable and not experience RFI

This is the part where I get on my soap box, Ask the old man if he knows how much difference there is in his signal strength between 1000 watts and 250 watts. I bet he wont know. The answer is:

You must double your power to increase your signal by 3 db, an "S-Unit" is considered to be about 6 db. So if:

1000 watts = S-9
250 watts = S-8
62 watts = S-7

Is it worth it to pay that high electricity bill for a couple S units of strenth? An S-7 signal is fully copyable. If he's trying to get a better signal look at his ground radial system on the antenna and dont look for the results by pumping more power into a weak radiator.

Best regards, and good luck,

Tim, ka8ddz

Message-ID: <19970727000801.UAA23552@ladder02.news.aol.com>
Source record: 169298

For years I always thought a 1/4 wave ground plane was equal to a dipole.
A lot of the hams I've talked to feel the same way.
Years ago I was setting up a test range to test the gain of 2 Meter yagi antennas.
I made up a simple dipole to use for a reference, of course it has a SWR of about 1.5 to 1. At the time I thought, that's not fair to use that as a reference against a yagi with a SWR of 1.1 to 1. So, I thought I'll just make a 1/4 wave ground plane for the reference antenna.
After adjusting the angle of the ground planes to get as close as possible to a 1 to 1 match, I tested it against the dipole just to make sure they were close to being the same. To my surprise the ground plane was down about 2 dB from the dipole. After scratching my head for awhile, I built another ground plane & I made another dipole matched with a gamma match. I test them all again & again in every way I could think of.

(My test was done with all antennas 8 feet off the ground)

The conclusion I came up with is the dipole has between 2 & 2 1/2 dB gain over the 1/4 wave ground plane. That would put the ground plane about the same as the isotropic radiator.

I just checked the "Scala Antenna Catalog" they have a VHF ground plane they show the gain (over dipole) as 0 dB (Unity Gain)

Has anyone else done physical test like this?

2356. Yaesu VX-1R antenna?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-27 00:00:00 UTC
From: n2vum@juno.com
Message-ID: <33daaf6c.1896999@news.netacc.net>
Source record: 169300

Dose anyone know if the VX-1R has a sma or bnc antenna?
And if you happend to know, how dose the antenna perform?
Is it deaf on all bands or pretty decent?

thanks....

That's an odd frequency to transmit on.

Howdy, Most of the big ham radio dealers have da mod. (I got mine from
the nice un named store in So Cal that starts with a J.) I would post
it but it would be very hard to explain and I don't have a scanner to
copy da board layout to a file. It exists in JPEG form somewhere on da
net. My copy looks like it might have come from the Icom mothership
itself. I removed 2 diodes and the radio xmits OK from 500khz to 60mhz
with a little roll off after 55mhz and from 138 to 170ish with roll off
starting at approx 155mhz. The radio makes about 40w from about 70 to
76mhz, but da tx power control has no effect and it makes me nervous.
Overall I am VERY happy and it was worth the wait. I would assume if ya
bought yur MKII from the "J" store, they might get ya da mod sheet. 73
and good luck, M!

2364. Standard C510 vs. Yaesu FT-50

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-27 00:00:00 UTC
From: bumologist@pipeline.com
Message-ID: <MPG.e4488a0fcd1dc5b989698@news.pipeline.com>
Source record: 169308

Trying to choose one of the little HT's????Read on...
I had a chance a couple of days ago to do a side by side comparison between the two radios.I bought a C510 due to the better RF performance,but only took the word of the salesman and a very quick side by side in the parking lot outside with some guy who had a FT-50.The test was done in a moderately bad Intermod area,there are several transmitters in the area,including cellular and pagers along with the usual business transmitters and mobiles.This area was near I 475 and the Ohio turnpike. It's not as bad as downtown Toledo,but it's a good place to test handhelds out.
I used a homemade 2 meter 1/4 wave whip I made and switched it back and forth to compare.First,I searched the Vhf PS bands.Both did ok,but the Standard was a little better,it had no intermod but the yaesu had a couple of freqs that pagers could be heard in the background.Then I searched the Railband from 160.200-161.500.The Yaesu was horrible!I could hear the NWS from 162.55 over the whole range!It was weak over most of it,but it was almost full scale every 100khz or so!The Govt.band wasn't too good either,lots of pager junk and some unknown female keying up occasionally (I think it was some kind of business from what I could make out).So far,the C510 is way ahead,RF wise.
Next,I checked the 440 ham band.This was a closer contest,but the C510 was still noticably better.The 453 and 460 PSB bands were ok on the Yaesu,except for a couple of specific freqs where pagers broke through.With the stock antenna,the Yaesu was clean,but deaf.The 510 was better in every way,except selectivity.Detroit PD was easily heard on the 510,was barely able to be heard on the Ft50.
Finally I searched the 850-860MHZ range.The Yaesu was annoying due to the squelch kept "popping"as it searched between signals(I set the squelch levels at "1"on both radios,the sensitivity seemed about equal).The yaesu had a few pagers where they shouldn't have been,and I heard a 440 repeater popping in and out in the 85X.00 range.The Standard was pretty clean,just a few static bursts over the whole search area.
All in all,the Standard has a much better receiver.The Yaesu wins in Audio output,Ruggedness,and probably water resistance.The PC programming is a plus too,but the intermod drove me nuts!The Yaesu is a much more difficult radio to learn to operate.The Standard wins in every RF performance category except adjacent channel rejection,it's just slightly worse than the Yaesu.The scan speed could be quicker,and there's a built in 2 sec.delay when a signal drops before it scans.It's not a radio for trunked listening,but for other bands/services,it's graet,plus it's so light!It also is amazingly sensitive on UHF,and very potent on VHF too.
In total,I'm glad I bought the Standard.....

THE VX-1R HAS AN SMA ANTENNA . THE STOCK ANTENNA IS GREAT FOR 2M AND 440 (HIGH-Q), BUT OUTSIDE 2M/440, IT IS A LITTLE WEAK. COMMET MAKES A LONGER, VERY THIN SMA ANTENNA THAT WORKS WELL FOR SCANNING AND IS ALMOST AS GOOD AS THE STOCK ANTENNA ON 2M/440.

For Amateur Radio a license is required to transmit -- excellent used transceivers can be found at about $200 and up. Range is world wide with good antennas and propagation. See URL:
http://www.geocities.com/SouthBeach/Sands/1961/old-month.html

For short wave receivers -- see URL:

My 2000H isn't intermode proof either, I think they were slightly worng in
saying it "vertually intermod proof". I understand ICOM has a fix for this by
the way, they know about the problems. Call them...

About a year ago I opened my passenger side car door on a to get some
packages out. It was raining VERY heavy. After being in my house for
about 10 mins I started looking for my Alinco DJ-580T. I couldn't
find it. I went to the car thinking it was on the seat, wrong! I
saw the antenna sticking out of the stream of water that was going
along the curb. Boy was I pissed. When I got inside again I put the
radio under a desk lamp for a few hours thinking it was all over.
Well to my surprise it still worked! And it is working to this day.
73, Mark

The reason the radio goes into Tx when you try to use a 3-circuit stereo
plug is that the radio uses a *4-circuit* jack. The barrel of the stereo plug
is shorting out the external mic line (and PTT). This is a bad thing to do,
because it shorts out the power being supplied by the radio for the external
electret (and for the "leaky" PTT). This *may* not cause internal damage to
the radio, but it does cause additional loading of the battery, so listening time
is shortened.

And of course it makes the radio worthless as a *transceiver* while the plug
is in place. The latter defeats the purpose of owning the radio. If all I wanted
was a scanner, I would have bought a scanner. I bought a transceiver, and I
expect to be able to both transmit and receive with it. That requires the proper
plug be obtained so an earphone can be properly wired up while leaving the
radio able to transmit.

I strongly believe that you cannot transmit AM signals with ADI's
AT-600. It is possible to receive AM mode, but shouldn't be capable
of transmitting... If you know anything regarding to this matter,
please let me know.

the super tech at Yaesu, they did not even get back to me.
No Tone Squelch above 470, seems crazy, should cover their so called
UHF-TV band , for 470-800Mhzm the Tone Squelch systems here are used
up to 512Mhz.
again, the Tone-Squelch in 170-222Mhz does not work and Tonesquelch
systems for VHF go up to 174Mhz!!!
I konw a number of people will not but the new VX1-R because of this,
and if Yaesu fixed this, their sales would increase dramatically.
I guess they don't listen to their customers!!!

From: 629371@worldent.att.net
Message-ID: <33DB963E.6586@worldent.att.net>
Source record: 169328

Just curious if anyone with a 990 has had a chance to test out/use the 920?

The 990 was tri conversion and the 920 is dual, but I don't believe that will make ALL that much difference...right?

Trying to decide between the two radios and any pointers in the right direction would be appreciated...especially interested in receive sensitivity and filtering - which one "hears" better...?

Thanks!

John

actually, ANY receiver can become a transmitter with two or three
changes, and without addiing any parts from radio shack.....the RF amp
will be the AF amp, and it isnt very efficient, but it can be done,
and makes a grea emergency locator beacon....

>will make ALL that much difference...right?

I would say that these rigs are not quite in the same class. That
is not to say I would discount the 920, it is a nice little radio,
but it is not a 990. The real difference would be in the IF filtering.
The 920 you state is dual conversion - not really - the one IF stage
has only FM filtering way up there in the VHF range, no crystal filters
optional here. Down around the 8 MHz IF they allow one filter for
CW. That is all you will get at IF, one 8 pole (monolithic?)
crystal filter. That is quite enough in most circumstances, and works
well with the AF DSP afterwards. The AF DSP has a wonderfully
designed control on the front allowing you to intuitively use it
to best advantage, but it is DSP at audio, with all the attendant
AGC pumping problems when your IF filtering is not killing all the
strong signals in the passband.

The 990 has no DSP, but allows 16 poles of crystal filtering at
many levels that you might want. That is very, very good to have
during heavy QRM conditions, like the 160 meter contest on CW. It
will do much better than the 920 then, in my humble opinion. The
990 can be run with audio DSP added on before the speaker,
theoretically just as good as the audio DSP in the 920 (but the
920 DSP is very, very nice.)

So, for most conditions, go for the 920, very nice little radio,
cheaper since you can't put too many expensive filters into it.
The 990 takes a lot of them if you want full flexibility, but you
gain some real strong signal QRM advantages.

I suspect that sensitivity is roughly the same, there are very
few significant differences between decent rigs in that respect
as far as I can tell, and outboard RF preamps are cheap so you
can always improve that one anyway. It is the easy part.

Good luck.

I bought a brand new FT-50R off a friend who decided not to get his
ticket for $300.00. I got the Radio, charger, FNB-41 and FNB-15 dry
battery pack, MH-34 Microphone, Extra Rubber duck, Dual Rapid Charger.
The only stipulation is mine only has the FT-11 Keypad.

Try switching to Group 2 Memory mode (Power ON + M/V), then
switch back to Group 1 Memory mode (Power ON + M/V, again).
I did this and then was able to overwrite a memory used on
a different band. (I think.)

I came across a SP-600 J3 Saturday. It was butchered by
some novice who likely had never soldered before.... it
will take some work to restore it to its former reception.

The main tuning condenser consists of electrically isolated
gangs individually grounded with sliding contact. 40+ years
have made these contacts slightly intermittent when tuning.
A general purpose electronic cleaner spray helps but isn't
enough. Any suggestions from Hammarlund pros about getting
rid of this noise???

I'd also like to get the service manual for this radio.

I'm not very knowledgeable about this area, so please forgive any stupidity on my part. Husband just got a Drake L-4B amp to use with his Yaesu FT-757GX. We just got his antenna (Antron 99?) mounted on the roof. He only talks on the 10 meter band. When not using the amp, we can hear him talking through ALL of our televisions, whether they are tuned to our satellite (C-band) or local channels on regular air.(no big deal) _However,_ when he keys the amp to talk, one of our VCR's cuts out, then shuts off; the large Home Theater TV cuts in & out(it actually shut down the other day while only the radio was on--manual said unplug it for 2 minutes because the electronic protection circuit had activated--thank goodness it came back on); one small TV cuts completely out until he lets off the amp key; and it has little or no effect on the rest of the TVs. He says moving the antenna off the roof & further away from the house will alleviate the VCR & TV cut offs. Is this right? I can't understand what the antenna has to do with this, especially the VCR. Any help? (Our radio guy is away at a hamfest.

Thanks for any help/comments

2 holer or 3? (how many tubes?)
I paid $1k for a 2 holer- very happy w/ it.
I saw a 3 holer at a hamfest for $1200--
depends on the tube condition, as they cost almost as much as the Amp.
Good luck -
Ernie

Message-ID: <xe1lo2qlieo.fsf@maneki-neko.cygnus.com>
Source record: 169147

Decent review. I picked up a VX-1R because I'm almost always within 3
or 4 miles of my primary 70cm repeater, and the size meant I'd
actually carry it more often... A few notes:

> It is a nice touch that the HT can run full 1W power off the supplied
> charger. (Of course, the charger is actually larger than the HT!!)

Since it's 6Vdc, it's also useful for running off a gelcel...

> stereo miniplug on headphones was a "standard" that should be
> supported.)

There is a short cable with splitter, but yeah, it would be nice to
not need it. (It's nice that clone-data is on the audio output,
though, instead of RF like the Kenwoods have -- anyone tried using
audio tape as backup? or a PC sound card for upload?)

> AM Broadcast receive - I have yet to hear any station on this band.
> The manual warns that you may need an external antenna but I have not

Actually, the "stand near a large metal structure" approach works
pretty well... though I'm using the Diamond SRH519 which is a better
antenna anyway. (The TH-78A didn't have *any* broadcast AM, and did
the wrong demodulation in some of the lower FM bands, so the VX-1R
wins there...) The scroll-bar frequency indication is kind of cheesy,
but then, I only expect to use the AM as a "public news source"
receiver, and the broadcast FM is more likely to be useful for that.

Mind you, I'm not getting *rid* of the TH-78A; I originally bought it
because it could do 5W on 70cm with the big battery pack, and you need
that to hit MIT from Logan terminal B2 (*under* the parking garage :-)
I may loan it to a friend to get them hooked though.

>> alone a dual band HT. The story for this HT is SMALL SIZE. If that is

That's for sure. Size, size, size.

I would like to know where to find specs and compatibility info on
both ARTS and DCS, and maybe info on the CLONE protocol...

2404. Re: Yaesu FT-50 vs FT-51?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-28 00:00:00 UTC
From: Phil Wheeler <w7ox@popd.ix.netcom.com>
Message-ID: <33DD58B9.7801@popd.ix.netcom.com>
Source record: 169149

I have both radios .. and I like them both.

Real easy to drop the battery off the FT-51: Bad design in that area. But the FT-51 is definitely higher in ham band features and is a true dual bander.

I prefer the FT-50, mainly because it has LOTS of audio on RX and is built with seals to make it WX resistant (I hike a lot); plus the battery retention design is much better. Many of its "features" are not of much value to most users; in the VX-1R (which I also own) Yeasu perfected this design approach!

I have a seven year old Kenwood TS-940S transceiver. The memory backup as shown on the schematic is a 3 volt lithium cell with a series diode for reverse isolation. I looking at my radio, there are two batteries, each diode isolated, in parallel. Does anyone know if this was a Kenwood mod? Is it desirable to replace both and maintain the same configuration or is one adequate? What is the correct part number for these cells? I took one out and it is a Sanyo CR2032 with solder tabs welded to it. I believe the CR2032 replacements do not have the tabs.

Professional VHF communications gear. 32 channel, 45 watt RF output.
146mhz-174mhz band.

The list price on this radio is $601 and the discount price is $464 as
shown on Advanced Digital Systems of St. Louis web page:

http://www.advdig.com/icommobile.cfm

See the above for further information and specifications.

The unit I have is Like-New-In-Box and has never been installed or used.
I don't have a need for this unit so I'm letting it go for $300 and I
pay shipping within the U.S. This is a savings of over $150 from the
discount price! You don't get a better deal than that.

I guess one would say if you trust the police, then ban the scanning, Unfortunatly if they don't think anybody is watching them they might be more likely to abuse the public trust a bit more than they already do. As much as a slug Rodney King was, if someone with a scanner and a video tape wan't there, we the people would have never know about the truth.

The police must operate in the open were we the people can watch and listen, so they are accountable to US. As soon as they are allowed to go unaccountable, they are no more than a GUSTOPO POLICE force. WE have the right to monitor and even change the laws because we the people put then there, PLease, PLEASE don't ever forget this.

2419. Icom IC706 MK2 Mods ..

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-28 00:00:00 UTC
From: Ray Withers <ray@raycom.demon.co.uk>
Message-ID: <33DD1DEC.4DBF@raycom.demon.co.uk>
Source record: 169198

Hello, I note that details of Icom 706 Mods are on the net.

I also note that it has been stated that removing diods will make the unit transmit on 70MHz (4Mtrs) ## This is not true !## The unit may appear to transmit after the mod, but the ##Transmit Frequency @70MHz will come out DOUBLE in this range ##

Also folks, if your IC706 Mk2 goes faulty after the mods, Then Icom #Will NOT# honour the warranty ! - So good luck anybody who does it !

73 ES GD DX Ray G4KZH = ray@raycom.demon.co.uk - www.raycom.demon.co.uk

The IF-232 doesn't care about baud rate, it is a level converter.

The 450 runs 4800 baud 8 bit, 1 start, 2 stop.

altavoz:
Are you getting as sick of this crap as i am ?!!
Never mind isotrpic antennas , we want real ant's !
Ppl make big mistakes selecting ants based on how easy
they tune to the coax (50 ohms) .
A 1/4w vert w/ 45 deg drooping 1/4 w radials is exactly
50 ohms and a perfect match to the coax (no SWR) , but
has a pattern that sucks unless you want to transmit to
airplanes .
But an invisible matching network of a simple coil makes
the much better 5/8w vert match to 50 ohms , so don't settle
for a 1/4w ant as it's lobe on the horizon is lower power and
thats what we need is power(alias gain) .
One exception ! If your sailboat heels alot , a 1/4w
might be better as the 5/8w loses gain as
you tilt it . I'm defining gain as that useful stuff you get
from a real antenna !
All practical antennas need to be shorter than 1/4w or longer
than a 1/2w to make them capacitive , cause coils that we need
to match the ant' are cheaper, easier to maintain , etc .
Antennas launch their power from a current maximum ("loop")
and the C' loop in a 1/4w is at the feed point which is why
it has a pattern pointing up at an angle from the horizon.
A 5/8 w has a current loop at the center of each of it's
radiators , so the power is directed to the horizon .
You are not limited in how many of these loops you can have
but deminishing returns at 3 or 4 ? make it cost effective to
put another 5/8w above the first with a voltage transformer
wrongly called a "trap" by many . It is a 1/4w stub, sideways
to the tip of 1st ant' (a shorted twin lead Xmission line) that has
very high Z at the tips of it's "U" shape.
So we go up 5/8w and then a sideways "U" for 1/4w then another
5/8w vertical . This is what i have ("Ringo Ranger II").
The "U" inverts the very high voltage polarity at the tip of
1st ant so that the 2nd 5/8w will accept power from the lower
5/8w . This "U" is only a "trap" if the upper radiator is not
about a 1/2w (5/8w qualifies as 1/2w) .
A 1/4w above a 1/2w with this "U" in between ,will not get power
, so we call it a trap under these conditions .

BTW
CB ant's with 90 deg radials are crap , they need to bend them
down 180 degrees and rematch the feed point w/ a simple coil of

wire .

J pole antennas have a very bad pattern and do not work .

I agree using just a cold water pipe is not enough but, IMO good RF
grounding requires a bit more than a single ground rod. One should
also "fan out" several ground wires just below the ground surface too.

I have not used an IC-820, but from all that I have heard the 821H is a substantial improvement, and my IC-821H (only 10 days old) is next to me now. Unless you are getting a very very good deal on an 820, I'd strongly recommend that you go for the 821H, which works well with a TNC for packet (to 9600) and has good satellite features.

I'm using my 821H primarily for 2 m SSB, and the reports coming in have been very pleasing. It is a bit short of power, of course, so I am going to get a TE linear to take it up to 350 W. It has effective built-in audio compression, but limited output audio processing, so I have it connected to a Timewave DSP-599zx - an excellent combination.

And did you read the original post? Hmmmm?If the topic was CMOS do you think Herb would be talking about diode checkers and phantom base-emitter diode voltage drops?
Yes, FET transistors are sensitive to static as are MOS transistors due to the thin insulating layer between the gate(s) and channel being susceptable to high voltage "punch-through". But why would you be using a diode checker on a FET not to mention a CMOS-or-whatever-you're-thinking-off device.

> Your statement "surely there's
> no way to damage an electronic component if you don't put power to it
> (short of crushing it)!" is misleading and dangerout information.
>

This is scare mongering. It is almost impossible to cover every angle of your post so that your rear is protected without hiring a lawyer. ANd then nobody would want to read it. "misleading and dangerous" - why because you might die if you get a static shock? or because the FETs (or

MOS technology) have open circuit gates and hence don't function?

> Check the facts, and just for good measure, give people a break.

Dave, you can also look at the QRP rigs from Ten Tec (www.tentec.com).
I think these are somewhat new and you will need to built it yourself.
However, they look appealing and even though I have on of those
all-mode all-band rigs I was thinking about buying one just for the
fun of building it.

But remember, the question was not about how
much power was radiated, but what was the gain.
Since equal power is radiated into half of a
symmetrical pattern (lossless ground, remember),
the gain is doubled.

Chris is right.

>con's etc.)

I bought the 756 as an incentive to finally take the code test. It worked and now I'm getting close to the 13wpm for Advanced.

The 756 can not be "the last rig" you'll ever buy. Memories suck, 6m repeaters are thus hard to use. Filters are "dummy proof" which means someone at Icom is actually the dummy. Nothing really major, but they could have done a lot better with the software.

On the other hand, the spectrum analyzer is a good learning tool. Using this radio is real easy because of the menus and soft keys. It has all the features for you to play with and figure out what is realy important. If you can afford it as your first radio, it should last many years. Even after you get that dream rig, you can continue to use the spectrum analyzer and have a backup rig.

If you plan on doing CW you will need a 500/350/250 filter. 250 is too small for RTTY. I got the 350 because you never know if you will be doing RTTY and I would never be able to decide between 250 and 500. Without the filter you'll have to resort to the audio bandpass filter and twin passband tuning, which is a pain but not ineffective.

I'm assuming that you already think there's some
constitutional "right" to be able to transmit a
signal in all directions and only have it heard
by the one party that you'd like to hear it?

Incorrect!!! ICOM America WILL honer the warranty as long as You cut
or removed ONLY DIODE # 116 and Diode #118. If you remove the other
DIODE #____ Then Your radio WILL transmit on the Btitish 4 MTR band
but you may blow the finals since there is a LOWPASS filter that doesn't
want to pass anysignal above 60 MHZ on transmit. If you remove this
filter then You can go for it. Simply add a Bandpass filter after the
Icom 706 MK II and you will be legal!
CHEERS, Steve Hershman NS1R

P.S. I have been asked not to give out the 3rd diode since it will
result in MANY failures showing up at ICOM Service.

2460. Gonset 901A Power Supply

I have for sale a Yaseu 2meter HT FT-11R HP this is the 5 watt
version. The radio and all components are like new. Comes with the
following.

Radio with original box, manual,charger,
battery FNB-38 (battery is 100%)
Yaseu MH-32 speaker mic.
Yaseu Soft case
Brand new FNB-38 battery (5 watt) this is an extra battery
Short rubber duck ant and LARSEN 2M HELICAL, 1/4WV BNC
Like I said all components are mint
Asking $230 shipped

2463. Re: Kenwood TS-570T Comments????

Source record: 169264

I love it. I posted the mod here yesterday and people are still asking for it. Next time scan the group for your answer before you ask the question !!

73
Len - KC2ADV

Extended transmit mod for the ICOM 706 MKII

This file may be freely distributed as long as it remains intact, with no modifications, additions, or deletions.

DISCLAIMER:
I assume no responsibility for damage or inaccuracies contained in this document. In other words, USE THIS AT YOUR OWN RISK. It worked for me, however I don't know if it will work for you.

WARNING #1: This mod requires the ability to remove surface mount diodes. Only those who are qualified to do this should attempt this mod.

WARNING #2: This mod seems to erase all memory channels, etc. You may want to save this info for reprogramming.

Disassembly:
1. Face the front of the radio towards you.
2. Remove the three screws in a row across the middle of the top of the radio.
3. Remove the two screws at the top rear (on the sides) of the radio.
4. Pry the top cover off from the back.
5. Disconnect the speaker at the connector.

Modification:
6. Near the top rear of the main circuit board, there is an small, oblong metal can. Directly below the right side of this can is two surface mount diodes with a white silk-screened box around them. There is also what appears to be a circuit board part number just to the left of it (mine says B4916D). Remove the LEFT diode in the box.
7. To the left of this, there is a test point marked CP3. Just to the left and above this test point is another box with two *vertically* mounted surface-mount diodes (Note: there is also a place for 5 more *horizontally* mounted diodes, with 3 installed). Remove the LEFT vertically oriented diode.

Reassembly:
8. Reconnect the speaker.
9. Put the top cover back on. Insert the top cover tabs into the slots and lower into position.

10. Replace all of the screws.

My radio did not require a reset, however I did lose all of my channel memories. It seems to be able to transmit everywhere except below .5 Mhz. I have not tested the power output at all frequencies yet.

I hope this helps everyone who have been waiting patiently for this mod.

Any comments can be directed to me:
Len - KC2ADV
email: lenny@handy-man.com

2468. Yaesu VX-1R Review

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-28 00:00:00 UTC
From: bobw@col.hp.com
Message-ID: <5rgqqh$1ef$1@nonews.col.hp.com>

A Quick Review of the Yaesu VX-1R
by Bob Witte KB0CY
25 July 1997

(C) Copyright 1997 Robert Witte
Non-commercial use permitted, all other rights reserved.

INTRODUCTION

This is a first look at the Yaesu VX-1R Ultra-Compact Dual-band Handheld Transceiver based on using the radio for a short period of time and reviewing the operating manual. This is based on my own observations and opinions --- you are welcome to disagree.

Check out the Yaesu web site for more information:
http://www.yaesu.com/vx1.html

This little HT is the smallest dualband transceiver in the world. If compactness is important to you, this radio has huge appeal since it is smaller than many pagers.

KEY SPECIFICATIONS

Frequency coverage: 144 MHz and 440 MHz ham bands (TX and RX), receive only on AM broadcast band and 76 MHz to 999 MHz (cellular blocked).

Transmit power: 1 Watt with external DC power or AC adapter
1/2 Watt with internal lithium-ion battery.

Standard CTCSS transmit and receive.
Standard DCS.
FM-wide mode for receiving FM broadcast and TV audio.
Automatic repeater offset (VHF and UHF)
Dual watch (priority channel)
ARTS (Automatic Range Transpond System)
52 memories (can be configured for 142 memories but will not save CTCSS and repeater offset in this configuration)
Alphanumeric labels on memories

BAND ORGANIZATION

The HT's frequency coverage is organized by "bands".

Frequency Receive Sensitivity (per manual)
AM broadcast 0.5 to 1.7 MHz < 5uV for 10 DB S/N
FM broadcast 76 to 108 MHz < 1.6 uV for 12 dB SINAD
Aircraft 108 to 137 MHz < 0.5 uV for 10 dB S/N

VHF Amateur 137 to 170 MHz < 0.16 uV for 12 dB SINAD
Xmit: 144 - 148 (sensitivity spec'd 144 to 148 MHz)
VHF TV 170 to 222 MHz < 15.8 uV for 12 dB SINAD
Action Band 1 222 to 420 MHz < 0.5 uV for 12 dB SINAD
(sensitivity spec'd 300 to 420 MHz)
UHF Amateur 420 to 470 MHz < 0.18 uV for 12 dB SINAD
Xmit: 430 -450 (sensitivity spec'd 430 to 450 MHz)
UHF TV 470 to 800 MHz < 15.8 uV for 12 dB SINAD
Action Band 2 800 to 999 MHz < 5 uV for 12 dB SINAD
(cellular blocked)

Note that while the receive sensitivity specifications are excellent in the 2 meter and 70 cm amateur bands, they degrade significantly at some of the other frequencies.

DTMF Generation

The most obvious thing missing from this radio compared to "full size" HT is the DTMF keypad. The VX-1R does have the ability to send DTMF tones via stored autodialer memories. There is also a manual mode where you select the DTMF digit with the knob and then push another button to send it. It is not easy but it works.

MENU OPERATION

To limit the number of keys, the radio uses a simple menu system for many of the features that other HTs have available more directly (transmit power, repeater offset, CTCSS frequency, squelch type). This causes the usability of the HT to suffer somewhat....another casualty of the small size. Given the space Yaesu had to work with, they did a reasonable job. I definitely had to read the manual on this rig but once I learned the user interface, it seemed to stick.

BATTERY

The radio uses a 3.6 volt Lithium-ion rechargeable battery rated at 700 mAh. The radio includes a bunch of features to aid in preserving battery life: low standby current, autopower off (off, 30 minutes, 1 hr, 3 hr, 5 hr or 8 hr), receiver "sleep" mode (off, 200 msec, 300 msec, 500 msec, 1 sec, 2 sec), selectable backlight modes, disable RX/TX LED.

The radio will run off of a single-AA battery with the purchase of an optional battery case. The radio puts out only 100 mW in this configuration. It is apparently highly compromised since the manual warns that this is only for "transmission in an emergency" since battery life is limited. The manual says that the AA battery case has a DC-DC converter that doubles the voltage of the battery to 3V.

The charger provides the HT with 6 volts DC, although the manual specs the voltage requirement as 3.2 to 7 volts. An optional adapter is available for operating from a cigarette lighter plug. The battery does NOT charge if the HT is turned on. However, the charge

time is less than 2 hours.

TRANSMIT POWER

The maximum transmit power is 1 Watt but only when plugged into external DC.

	Ext DC	Lith-Ion AA
High	1 W	500 mW	100 mW
Low	200 mW	50 mW	50 mW

I expected the 500 mW output power to be a bigger limiter than it is. So far, I have been able to access most repeaters of interest without much trouble.

It is a nice touch that the HT can run full 1W power off the supplied charger. (Of course, the charger is actually larger than the HT!!) However, the Errata sheet that came with the manual says "The [charger] may be used to power the VX-1R if no charged battery is available. However, transmission in this configuration may result in some amount of extranous hum and noise being transmitted, due to pickup along the DC line to the radio. We recommend that you transmit, using the [charger], only in an emergency." Now this seems really lame considering the radio is advertised as putting out one watt with the supplied charger/power supply. I checked my radio for hum when transmitting with the charger. There is some present and it varies depending on the position of the HT. However, it is not very objectionable and is no worse than other HTs transmitting with the charger plugged in.

MIC/EARPHONE Connector

The mic/earphone connector is a non-standard 4-pin jack that Yaesu is apparently starting to use on their smaller HTs. I tried to plug in a conventional earphone and it must have grounded the PTT line because the rig went into transmit mode. A look at the schematic reveals that the four connections are:
- Earphone audio
- Clone data
- Mic/PTT
- Ground

This seems like a waste of pins to me. I'd rather have a standard jack so accessories can be shared with other electronic devices. (A stereo miniplug on headphones was a "standard" that should be supported.)

ANTENNA

The antenna jack is an SMA (not a BNC). Apparently, the antenna does not work well on the AM broadcast band, so the manual recommends you hook up an external antenna.

OTHER FUNNY THINGS

SCANNING - As reported on the net, this radio is so "band-oriented" that you can only scan memories associated with the band that is selected. So this means that you can scan a collection of 2M frequencies OR a collection of 70cm frequencies but not a collection of both. In addition, CTCSS squelch is not useable when scanning. Memories with CTCSS squelch turned on will be skipped over by the scan. (If you set the squelch to a very low setting, it will sometimes stop at the busy frequency.)

BAND CONSTRAINTS - Another consequence of the strong "band orientation" is that CTCSS squelch is not available on all frequencies. For example, the VHF TV band must be used to receive a two-way radio transmission at 171 MHz. However, CTCSS squelch is not implemented in the VHF TV band, so there is no way to use CTCSS on 171 MHz.

ARTS (Automatic Range Transpond System) - This feature allows two HTs with ARTS to automatically keep track of whether they are in range of each other. Sounds to me like a feature looking for a problem to solve.

AM Broadcast receive - I have yet to hear any station on this band. The manual warns that you may need an external antenna but I have not tried that yet. Even more bizarre is the wacko tuning mode that is used on AM broadcast. Instead of a frequency display, there is a bar graph that indicates where you are in the AM band. This all seems quite silly given the low cost of the technology needed to do a good job with AM broadcast. This mode is highly compromised for typical AM listening.

DUAL WATCH The Dual Watch (Priority Scan) seems to work correctly even with CTCSS squelch. Basically, you can monitor one frequency and have the HT periodically check for activity on the priority frequency. Since the HT has only one receiver, there is a slight interruption as the receiver switches over to the priority freq.

APPROPRIATE USES FOR THIS HT

The best applications I can think of for this HT are:
- Situations where transmit time and output power are not critical but having an HT handy is important (Field Day, hamfests, etc.)
- A "second" rig when a higher power radio is available but not right at hand. (Carry this one on your belt and grab the higher power radio if required.)
- Traveling (toss it into a corner of your briefcase or purse and have 2M, 70cm, airband and FM broadcast all in one extremely compact radio)
- Crossband repeating via a high-power mobile rig

I would definitely not recommend the VX-1R as your only radio. I think you would really miss having higher output power, more robust

scanning and a DTMF keypad...get a full-featured HT or mobile rig instead.

YAESU Marketing

One of the major problems with this HT is that Yaesu is overstating its capability in its advertisements. For example, Yeasu claims the radio has 291 memories. While this may be true in some contorted manner, for people that want to save the repeater offset in memory, the actual number of memories is 52. Similarly, the AM broadcast receive capability is being promoted but is mostly useless.

SUMMARY

While it is easy to pick at some of the weaker points of the radio, it still is an awesome piece of technology. The capability that Yaesu has crammed into this little package is impressive. I can't think of a single-band radio this small from any of Yaesu's competitors, let alone a dual band HT. The story for this HT is SMALL SIZE. If that is important to you, check out this radio. If an extensive set of features implemented very well is your hot button, you probably need to look elsewhere. Maybe next time Yaesu will spend their software effort implementing a better scan feature instead of stuff like "ARTS".

James, how can you be so arrogant and wrong at all the same time?
Ever hear of ESD? Basically, it's static discharge. Walk across a
room in the winter on synthetic carpet and touch the door knob. That
zap, if applied to a circuit board with CMOS or other sensitive
components can DESTROY it completely. Your statement "surely there's
no way to damage an electronic component if you don't put power to it
(short of crushing it)!" is misleading and dangerout information.

Check the facts, and just for good measure, give people a break.
Someone out there might just know more than you.

By the way, my Beckman DM25XL meter does the same test as the guy
described. Works great.

2470. Alinco DJ-F1T TX Mod?

I have the 8000, but I am using it exclusively as a base. One problem I have is that it seems to be susceptible to eletrical interference from my PC. I have also heard that it is susceptible to electrical interference from automobile ignition systems (In my opinion, automobile manufacturers are somewhat at fault here. The ignition/alternator whines I have heard are a function of the automobile model: Toyotas-good to Fords-bad). Aside from this electrical interference issue (which is probably the case with some other brands and models anyway) I am very happy with the radio. It has very useful features, such as the one way cross band repeat. Of the four most popular radios in the dual band mobile class, the FT 8000 is the only one, which I know, with this feature. For this reason, I am glad that I bought it. The Audio is light but more than satisfactory.

Nice radio with a very logical and effective menu system. I need this with four rigs (mobile, base and 2 HTs) from three different manufacturers.

You should enjoy the rig.

I have heard this garbage on the news groups for years, and have never had anyone show what these "Changes" are. Fact: all modern superhetrodyne receivers do have oscilators, just like transmitters, but at very low power. Without major modification, they will not transmit a signal strong enough to be received beyond a few feet. And there is always the little matter of modulation. If you have other information on how to change a receiver into a transmitter without adding parts, post it here or stop posting what you don't know about.

Elderly ham unable to operate due to health reasons, so I am posting his HF rig.
Swan 500C, 117XC PS/Spkr., Shure 444 desk mike, homebrew RI tuner. 10-80M, cosmetics VGC plus, operates very well, in regular use up until 3 weeks ago, just a nice old broad-shouldered tube type rig, $250 plus the UPS from Rochester NY, or full/partial swaps for 2M or dualband rigs. My shack is too small to accomodate many more treasures or I'd keep it myself.

Also from the same shack, a large number of boxes of parts, rel;ays, caps, some tubes incl. what appears to be a new 807 and a new RCA 829B electron tube, endless wire leads/jumpers/etc, a Shure 450 mike, a couple of various power supplies and other unfathomable machines, literally thousands of parts here, start your own hamfest table. Included as well as a goodly qty. of antenna fixins, incl. a wide spaced homebrew 10M 3 el, at least one 11M 3 el., who knows what all else, all apart and mixed together but sure would be fun creating Frankenstiens monsters with all of the parts here.
Want to move it out, obviously local pickup only, bring your station wagon and some cash, or trade stuff? (old 2M mobile/HT, working 11M SSB stuff??) We'll come to terms. One thing, please, I do not want to cherry pick parts on request, 70 hr weeks just don't afford me that luxury.

Email replies please

We are currently fighting some TVI and telephone interference problems here
also - nothing anywhere near as serious as you describe. So far, my
biggest improvement was in going to an antenna that is on a mast over 100
feet from the house. The antennas that are directly above the house cause
interference. It does seem that distancing the transmitter antenna from
the home appliances is effective - at least in my case. I only operate 80,
40 and 20 mtr bands. Your problem sounds like it's a job for the Orkin
man.

Hello-

I have two of the Tasco/AOR TSC-100A Telereader SSTV converters and I am looking for information on upgraded software for them. The PROM in each is marked 'TSC-100 Tasco 93.11.08'.

With the current software, they cannot run in Scottie or Martin modes (the most popular in the U.S.). I had information from another owner who had his unit upgraded but I lost it. I tried Tasco's current address in Hawaii but they haven't responded.

Please send me a direct response if you can help me. Thanks-

2482. Motorola MT500 UHF Mods for Amature Use?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-28 00:00:00 UTC
From: Jim Tonti <jtonti@microtest.com>
Message-ID: <870075464.5588@dejanews.com>
Source record: 169279

At the recent ham fest here at Ft. Tuthill near
Flagstaff, AZ (USA), I purchased (for a *great* price)
a few old Moto HTs. Now the problems is how to use them
for ham work!...!

I have several questions about the Motorola MT500 (aka 'MT-500')
UHF HTs. I am interested in converting the following models to UHF
ham use:

MT500 H34BBU3144A, 4 Frequencies, 6 PL tones
MT500 H24BBU3184A, 8 Frequencies, fixed PL

Have you modified the Motorola MT500 UHF radios for ham use?

Can the PL be changed?

What is in the Transmit and Receive 'Elements'? Schematic?
Modifiably by 'hand'?

What frequency range can these radios be made to work over?
With no adjustments other than 'Element' swaps?

Do you have a URL of further info on these radios? I have searched
the newsgroups for 'MT500' and 'MT-500', as well as the web, and
found only people trying to sell them. Surely they can be used
for more than paperweights! (Should I have asked the seller pay me
to take the radios????? I hope not.)

Please respond, if possible, via email and the group.

Hopefully posting...

73

Ok I need a Vocab breather.

Where can I get a definition of the terms used in this letter so I can understand what the blank he is talking about. I will be a sophmore in EE at Oregon State and I am interested in radio theory.

I have built DiPole antennas for my CB radios and then blown and replaced pre-finals in my radio (didn't know what I was doing and tried to set up di-pole in room tied to door knobs). I then set up a quarter wave antenna, Antron 99 which is a really nice antenna tuned to 27.255MHZ which has so many db of gain, which means nothing to me and Websters is no help, 144 db= Airplane noise level?. I know what isotropic is with regards to the etching process of silicon wafers. I have no idea what it means here. ARG. What do I do.

Thanks.

A local ham just had the same thing happen to his FT-51R. He believes
that it occured when an aftermarket battery pack made intermittant
contact.

This sounds VERY much like the results of a mod that you can do to the
FT-51R. If I remember correctly, jumper 6 is opened on the PCB, jumper 7
is opened, and then the unit is turned on in a hidden software setup mode.
After making a change in a parameter, the unit is turned off and jumper 7
closed. The result is similar to what you describe, except the 2m
transmit range is not compromised. Have you tried any mods?

Try going into this hidden menu:

1. Set band select to left-hand side.
2. Turn off radio.
3. Hold down both up and down volume controls and call button
AT THE SAME TIME WHILE PRESSING THE POWER BUTTON.

Does it say :BAND 7?" I should read "BAND 1?"
Let me know what you find.

When in the voice-mail mode, the incoming message is supposed to be recorded and then a previously recored reply sent--according to the manual. On the FT-50RD I had a few months ago the incoming message would record, but then the INCOMING message would be retransmitted. Perhaps not really a problem, since this does verify that the message was received, but still not as advertised in the manual. If your's does not do this, perhaps it has finally been fixed...Now if them would only allow banked memory and a priority mode that works while scanning, like the FT-10 and FT-40.

Ron,

I've had an FT-51R for over two years and am very happy with it. Still, I wanted to try something new, so I ordered an FT-50RD from HRO.

I liked it,...and I didn't like it...

The FT-50 is certainly a rugged radio, though the FT-51R has held up pretty well--Many drops, a little superglue to the case (Only about $8.50 to get a new front for the case from Yaesu parts, though I don't need one--Yet!). I liked the concentric knobs on the top of the FT-50. The intermod rejection was better on the lower end of the 2-meter band; not as good on 440, though my tests there were limited. The FT-50 receives 800MHz.

I ordered the FT-50RD with the high-power battery pack: It just felt too "fat" in my hand (Though Maha has a NiMH high-power pack the same size as the low-power Yaesu pack.). The "voice-mail" feature did not work as advertised in the manual: Instead of transmitting a reply when someone leaves you voice-mail, it retransmits the mail--a minor problem! I suppose the biggest thing I missed compared to my '51R was the ability to be in two places at the same time: The "priority" watch is very limited, and does not operate while scanning. While this is also true of the FT-51R, with the FT-51R I can just leave one "side" of the radio on the frequency I am monitoring while I scan or do whatever on the other "side." The FT-50 is not a dual band radio in the traditional sense: It has just one receiver, not two.

The latter was the deciding factor for me, though it certainly may not be for others. It all depends on your operating habits. Barry at HRO in New Hampshire was kind enough to allow me to send the FT-50 back and issue me credit. I used the credit to buy ANOTHER FT-51R!

Oh, to answer your question, which is the latest model? The FT-50RD. However, the FT-51R has not been discontinued. The FT-50RD is a DIFFERENT kind of radio, not necessarily a BETTER radio. It does not seem to be the successor to the '51R.

I hope this helped to answer some of your questions.

2492. HELP Icom IC745 PLL problem

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-28 00:00:00 UTC
From: mc6164@mclink.it
Message-ID: <5ri2rleuk1@tilde.csc.ti.com>
Source record: 169289

Hallo all,

I would like to solve a nasty problem my IC745 developed some time ago. Reception in the range 8.00 MHz to 14.99 MHz becomes garbled and at times disappear totally. The problem is temperature dependent (in summertime when temperature in my home raises over 25C it is very bad) and it is aggravated by the fact that I have the internal power supply option installed.
I tryed the standard line up procedure of the PLL unit, set frequency to 14.99 MHz and adjust C88 to read 6.5V on R46, shield end, then set to 8.00 MHz and check for voltage > 1.7V . I also repeated the procedure after heating the PLL circuits with a hairdryer and I can get the receiver going well, but just for a short time.
I can also say that all the other bands are working fine on any conditions so I really suspect that the problem is due to the circuit that is unique to the band 8.00 to 14.99 so that the oscillator output becomes so low that the PLL can not lock any more.
Any suggestion will be very appreciated. By the way, in winter time when maximum temperature in my home is 18C, the transceiver operate flawlessly but suggestions to mowe nearer to the North Pole wont' be considered...

Thanks in advance to whom will help,
Giovanni

If you think about it most of the people who probably shouldnt be in the hobby drop it after a year or so. They get tired of the chit chat on the 2 meter repeaters and cant seem to think of anything else to do. In the 8 call area were up to KC8J** (Ran out of tech calls) and its getting hard to find any N8's from 4 years ago.... Even the KB8's are starting to dissappear.... I dont see that were "dumbing down" more people are getting a chance to try the hobby but not all of them are staying....73

I would strongly suggest that you get a replacement cell WITH LEADS already welded to the case. I tried carefully soldering wires to an off-the-shelf CR2032 Li cell only to have the thing explode in my face! I am told that it can be done, but I doubt that I will try it again. I think I saw the leaded replacement cell in one of RS's RSU catalogs.

I've dealt with AES on numerous occasions since 1981 and even visited one
of the stores a couple of times. I had only two problems in all the times
I bought through them, and they were both taken care of with NO problem.

Every one can make a misstake. Get my point??????

Greetings -

The following Test Equipment has not been tryed except where noted. All shipping will be from zip 98837. I'm open to questions, offers, or trades.

1. Accurate Instruments, Inc. GENOMETER Model - 156
250 Khz to 120 Mhz Signal Generator with sweep and tone.
$25

2. MILITARY - RF OSCILLATOR Module for a AN/SRT-14 or -15 or -16. New, never used spare in packing box. Complete with tubes and 100 Khz crystal in a very nice oven.
$25

3. EICO - Signal Tracer Model - 147A with calbes and probes
Eye tube and lights brightly and seems to work
$25

4. MILITARY - TUBE SOCKET ADAPTER KIT MX-1258U
Metal Case with Book in lid. Consists of 7 various sized tube socket plugs which allow monitoring of each pin from the top of the chassis.
$15

5. MILITARY - TS-505C/U VTVM. Untested and dirty. Looks complete with probes in lid of metal case.
$20

6. MILITARY - A/N PRM-10. Very Nice 5 tube Grid Dip Oscillator. Complete in metal case with all coils, no book. Looks old, but very good condition.
$50

7. GENERAL ELECTRIO - Gernanium Diode Tester Model 45T12A1
Complete in Case.
$20

8. MILITARY - TS-375A/U RF/DC VTVM of some kind. No probes and lid of metal case in missing.
$15

9. MILITARY - TS-505D/U Output Meter in Metal Case.
Complete
$15

Cathi, the antenna is what radiates RF. It is RF which is overloading your appliances. Getting the antenna further from the appliances means that they well be exposed to less field strength. Field strength decreases with the inverse square of distance, so getting the antenna twice as far away reduces the signal strength at your appliances four times, moving it four times as far away reduces signal strength sixteen times, etc. Antenna height and distance are your friend when it comes to reducing RFI.

VCRs are especially vulnerable to overload from strong RF signals because they use the same frequencies internally that the HF amateur radio equipment uses. If the VCR isn't well shielded, most aren't, it will pick up the RF from a 75m or 40m amateur station and think it is seeing the RF signal off the tape (VCRs record video as FM signals in the 4-8 MHz range). This will cause severe picture disruption, and can even cause the machine's servo to lose lock and go into fault shutdown.

> into
> the other hemisphere (below the ground plane)...

No, this is incorrect. You're ignoring the image. You can't ignore
something
just because it's imaginary. And you can quote me on that. :-) Far
zone E
and H fields are equivalent to those of a half wave dipole.

In general, virtual sources arise from the presence of a ground plane.
An observer
above the ground plane will detect a direct wave as well as a reflected
wave,
which appears to come from a source below the ground plane. Another
observer
located elsewhere above the plane will also view direct and virutal
sources from
the same locations as observer #1. The total field above the interface
is equal to
the sum of direct and reflected components. Your assumption above is
that these
fields always add constructively - which, of course, they don't.

> BradHi Brad,

I'd have to vote for the Ten Tec Omni VI+. I recently looked at all the new rigs- including the JRC 245- and bought the Omni. If you are impressed by secondary receivers, memories too complex to use, and hundreds of bells and whistles then the Japanese rigs will be for you. But if you want a radio that performs well in weak signal and crowded bands- The T-T is for you. Now, my uses are a little out of the norm. I do not work SSB and 80% of the time the radio is used as an IF for 1296 MHz EME. Here I need to be able to crank filters and DSP in/out quickly w/o jerking w/ arcane menues.

I do not work for T-T, just like the rig.

Hello dear Motorola users,

I a building a MDC1200 HamRadio application and would like to
use my GP300 and a M120 (both 2 Chn & PL Signaling).

What I would like to do is to enable 16 Channels and MDC1200
on both radios. Also I am wondering if the MDC1200 caller ID
can be output on the rear 15pin connector on the GM300 Radio ?

I was told by some helpful people of this list that what I
had to do is to blank the Radio's EEPROM and set new model #
in them. And of course replace the M12O's head by a GM300 one.

Can somebody send me the LabTools utilities to Swap the model
number on my radios - Thank you very much for your help.

73's - Daniel.

From: Anthony Steen <anthony.steen@unisys.com>
Message-ID: <33DE3157.78B6@unisys.com>
Source record: 169105

Is there an RS232 Control Software package available for the IC-706. It can be FREEWARE, SHAREWARE or a commmercially available product that I can use on a try & buy basis. I have "diddled" with a number of other software packages that claim (and do) interface with ICOM radios, but there is always something left out for the IC-706 specifically.

I think I read a message in this newsgroup (a while back) of someone who was offering such a software package. But you know Murphy's Law....I wasn't interested in it then! I would appreciate any info.

Please use the following E-Mail address as this site gives out false E-Mail addresses:

The primary service is government. 170.245 is a specific freq allocated
on a secondary basis for wireless microphones.

Message-ID: <5rld1c$ues@camel4.mindspring.com>
Source record: 169112

Ok, I know I'm going to open a can of worms,
but before I lay down the cash (or plastic) for my new
rig, I'd like your honest opinions (preferrably those of people
who have used both rigs in question). I've read the comments
regarding comparing a TS-570 to an FT-920...understandably,
there is a price difference, and they were created at different times.
However, here are the two rig setups I'm contemplating:

A TS-570S with the YK-88C-1 500Hz CW filter...
or the FT-920 with YF-116C 500Hz CW filter...

Apples and oranges? You tell me...Is it justifiable to plop
down a few hundred more for the Yaesu? I've been a diehard
Kenwood user for years and I don't know about Yaesu reliability.
Comments, diatribes, or flames...post here please =)

2515. Re: "Hear stations you've..."

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-29 00:00:00 UTC
From: turner@safety.ics.uci.edu
Message-ID: <5rlekt$t7c@safety.ics.uci.edu>
Source record: 169113

>> I guess we've all seen the advertisements from Kenwood, Yaesu, Icom and
>> Ten Tech, for "Buy this rig and hear stations you've never heard
>> before!"...

Well, I see this as mostly hype. I have had the big rigs on my
desk, many side by side, and the difference between the FT 1000D
and the lowly Kenwood TS 440 is not large when it comes to "hearing"
a weak signal in the clear. Really. There was nothing that the
FT 1000 could "hear" that the 440 could not "hear". Now, the clarity
and work my ears had to do would differ in some circumstances, but
in 99 per cent of the cases, the difference was slight. Some
radios may need an alignment, and there the sensitivity will be
an issue. Some rigs have a loose ground generating some real bad
noise, and that is an issue. The "phase noise" of the receiver is
an issue that comes up with strong QRM in the passband of the
1st receiver IF, and that is another theoretical issue that seems
to make some difference, though I have not been able to dig out
a signal with my OMNI VI that the FT 1000 or the TS 940 could not
hear at all. Again, there is an audible difference, but not the
"night and day" difference that may be advertised. I suspect that
there are conditions (try the 160 meter CW contest with a good
antenna sometime!!!) that make the difference really show up. Those
are not frequent, and I would merely advise you to take your major
operating desires into account with the likely worst conditions that
you intend to work in, then choose. I like many of the rigs, but
choose Ten Tec for my own reasons, though I like the Japanese high
end rigs too. My OMNI VI will do things I want it to do that some
of the Japanese rigs cannot quite do as well, though I know that
I would be working the same stations with almost the same ease
if I had, say, the FT 1000 still on my desk. Can't afford both
right yet, hi hi. I would say that if SSB was my favorite mode
I would maybe, just maybe choose the 1000. But I choose CW and
SSB about equally, and the OMNI excells on CW and is quite nice
on SSB (but the "slope" type tuning on the 1000 and 950 type
rigs is quite nice for SSB, it is not part of the OMNI....part
of the tradeoffs you must make when choosing the receiver you
want.)

I have little respect for the antenna ads that claim lots of gain,
little respect for the latest DSP claims (yeah, the DSP is helpful,
but it does not make an inaudible signal audible in any situation
I have ever seen yet... maybe someday.) So, take the ads with a
healthy skepticism, then try them all as much as you can, that is
the only way to tell which receiver fits YOU best. Then buy the
Ten Tec OMNI VI+, hi hi. Or get the FT 1000D and we can alternately

swap them and have fun comparing. Good luck.

But his question was not WHICH ht to buy, but WHETHER we recommend buying one.

I think he is going to get lots of different advice from hams with
different interests, and my own recommendation is to work on the upgrade as
soon as possible, and to get an hf radio where he can do something more
interesting. More interesting to me, anyway. He will have to decide for
himself whether he wants to talk to people all over the world, or just a
bunch of local buddies on a repeater. :)

Incidentally, why would he be interested in "listening/transmitting"
outside the amateur bands? Listening I understand. But transmitting?

Hi all,

I have an Astron 30A 12vdc power supply (RS35A may be the model number, I forget) that has developed a nasty habit.

Twice in the past week, during periods when the commercial AC power was going off and back on due to local thunderstorms, the power supply has malfunctioned. It had a small load (approx 1 amp) on it when this happened. I discovered about 2 hours after the storm that the supply had apparantly quit. Upon checking, I discovered that the heat sink was **VERY** Hot, and the supply appeared to be laboring under a high current load. However, after disconnecting each load, leaving the supply running, I discovered that the supply's output voltage was 0.76 volts with no load attached. It still appeared to be under a load based upon it's transformer hum.

Turning the supply's AC power off and back on corrected the problem, and all appeared normal. However, it got back into the same condx again a few days later after a storm. I have not been able to duplicate this state by quickly removing and applying ac power.

Anybody had a similar experience and have an idea as to the failure mechanisim?

Thanks,

Dennis

In the UK that part of the band is in the transmit section of the PMR band, with the RX section around 166MHz. I also know that the British military use AM on about 170.0125MHz.

Most VHF xtal-controlled rigs for the 2-meter band should be re-tuneable up there, possibly needing the odd capacitor/coil reduction if it cannot be tuned exactly. Replacing ferrite slugs with brass will often do the trick too.

I have some 2-meter stuff on my homepage, but it is somewhat limited (ZN414 receiver and a simple FM transmitter) for your application.

Eric,
Since you chose to tell my boss how it is, let me pass on some
editorial remarks made on your submission.
First, notice that while your discussion partner, Alan, expressed views
with which you disagree, he did not/ whereas you did:

1. Insult the education of the other.
2. Choose to insult the other modes of operation choosen by the other.
3. Resort to name calling..."loser" "backwoods people" "living in the past"
4. Resort to psychobable "Isn't denial wonderful?"
5. "Taking the name of the Lord, your God, in vain." as proscribed
in the commandments we keep trying to communicate to you recalcitrants.

Second, that you disgrace yourself by your behavior in front of the
whole newsgroup audience. We can read, and compare what you do,
while remaining as impartial witnesses.

Third, take it from me, the lowly secretary, clean up your act, before
you take on the job of educating my boss.

Concerned,

God's secretary. www.qsl.net/chaplain

It is now available for a free trial preview at http://www.liquidaudio.com.

This new product from Liquid Audio is like an on-line version of a typical CD, allowing you to see the album graphics, lyrics, and linear notes while listening to a radio station, for example. There are many cool new features like the personal music library management, and my favorite, the ability to record an actual audio CD over the Internet that you can play in all your CD players.

Right now they're giving away a Recorder, to create your own CDs, when you download the trial version. Just click on "Get Liquified" from their site and you'll be eligible.

Let me know how you like it.
Julia.

For any of you new hams out there... Often it is asked, "Which radio do I buy?"

I don't know the poster so I base my recommendation on his post. This is a great radio. If I weren't trying to buy a house right now, I'd drop my own cash on this one.

Its *exactly* the same as a TAPR TNC-2. Or an AEA PK80. Or early
Paccom models. Most of an MFJ TNC manual will also apply, you'll
observe the MFJ PCB layout started as the TAPR TNC-2.

Look for a manual and schematics for sale at http://www.tapr.org.

Hello All;
I'm selling a brand new still in the box Yaesu G-800S rotor,
control box & connected rotor wire. Also included is the Yaesu
Warranty registration.
Braking torque:289ft-lbs, Rotation torque:43.5-79.5ft-lbs, Max
Vertical load: 440lbs, Wind load area:Tower/mount less .45m2 &
Mast/mount less 2.2m2 Mast Diameter 1-2inches, Rotation range
450degrees +0/5. Other details will be detailed via telephone.
Reason 4sale is: I'm using an az/el rotor for satellite work.
New it costs $389.00 I'm asking $300 shipped OBO
All cash offers will be considered..
My phone# is: (609) 386-9382 but sorry it is busy most of the time.
You can try though anytime from 10am to 10pm ET..
Or RE: via Email to: n2rif@amsat.org
Packet: N2RIF@WM2F.#SNJ.NJ.USA.NA

Now what have I ever done to deserve a reply from Altavoz? I mean, here's a guy who, at only two reference levels deep in this thread, is already "sick of this crap". Yet elsewhere, we can find Altavoz, thoroughly pushing the limits of sanity at greater than 30 reference levels, lamely arguing against everyone, about auto alternators not creating alternating power.

> Never mind isotrpic antennas , we want real ant's !

Then select a warm day, lay back on the ground, and smear yourself with honey. If you do it right, they will come.

> Ppl make big mistakes selecting ants based on how easy
> they tune to the coax (50 ohms) .

So you don't like the concept of maximum power transfer?

> A 1/4w vert w/ 45 deg drooping 1/4 w radials is exactly
> 50 ohms

And why would 45 degrees be the optimum angle of your radial dangle?

> and a perfect match to the coax (no SWR) ,

Only if you live in the land of coaxial compromise; maximum power handling ability is found in a lower impedance system, while minimim loss is achieved above 50 ohms.

> but has a pattern that sucks unless you want to transmit to
> airplanes .

Wouldn't you want a receive antenna to truly suck? And that's such a clearer image than thinking in terms of effective area or aperture.

> But an invisible matching network of a simple coil makes

I don't think I have ever seen an invisible matching network.

> the much better 5/8w vert match to 50 ohms , so don't settle
> for a 1/4w ant as it's lobe on the horizon is lower power and
> thats what we need is power(alias gain) .
> One exception ! If your sailboat heels alot , a 1/4w
> might be better as the 5/8w loses gain as

> you tilt it . I'm defining gain as that useful stuff you get
> from a real antenna !

I can't tolerate this any more. You nitwit, the "useful stuff you get from a real antenna" is called radiated power. And gain is the measure of efficiency and directional characteristics of that radiated power.

I've snipped the rest of your steaming pile of a post! Disinformation should not be repeated unto further generations.

To borrow your nautical imagery, your sailboat has lost its keel, been dismasted, is abeam of the waves, above a lee shore, and you've never heard of a sea anchor. If you get back to shore, rejoin your thread arguing for the mutilation of Honda front-end geometry.

And as for antennas, I suggest you always keep both of your hands in your pants pockets at all times. Not only will you find this comforting, but you will eventually be able to find your own ass without assistance.

I just wanted to state my opinion on the Yaesu VX-1R well here it goes I think it is a great "scanner" the way it is set up it is great if and only if you keep these things in mind first of all it is a very small and handy scanner with what appears to be a very long battery life and as you all know very few scanners have tone squelch ability therefore it shouldn't be missed second it has broadcast receive ability's witch very few scanners have mind you the receive isn't great but it does work third it has 1/2 a watt ham transmitting ability's witch is awesome if you look at the radio that way it is a great radio but if you want something else that is more than that oh well your looking for a radio that at this time doesn't exists to my knowledge so if you like the sound of this get the radio.

BTW I don't own one "yet" but soon will.

P.S. I don't think that there is a firmware problem it's just the way that they designed it.

>never got the chance. For the moment the right side is still working ok.

Hello, I've had my 610T for about 1 1/2 years now. Never had problems
with the lights but I started having problems with the channel knob
about 5 months after I bought it. It was still usable so I kept it
until the 1 year warranty was almost over to see if anything else
would go bad. Nothing else happened.

I sent it off to be repaired (I still think Alinco should pay Shipping
both ways) and got it back after about a month. I also met someone
else that had the same problem.

It started again after about three months from the time I got it back
and now the radio is doing several things. It's busy light comes on
and no signal present, While it's on, current drain increases to about
4 amps like it's transmitting but no signal is being sent, at least
not on the one the bfo is on. It's fan makes loud noises at times, It
was doing this when I sent it off but Alinco said there were no
problems with the fan. Don't think I noticed before but the Case is
warm (not hot) to the touch even when I don't transmit.

I just bought a Kenwood TH-79AD a few months back with a problem
occuring now. The af-gain has static.

They are well kept radio's. The DR-610 is mainly setup as base with
occasional mobile use and the HT is well taken care of. There must be
a thing called LUCK! I just upgraded to Tech+ and now I'm afraid to
purchase a Quality radio. I can't afford to send them all back every
few months.

BTW, The first Ham radio I had was a Radio Shack HTX-202. I had to
send that radio back twice but the store did the shipping and after
the second time I had no further problems with that radio. I sold it
because I wanted a Dual band HT. Should have kept it.

FOR SALE
CB equipment:
Browning Golden Eagle Mark III three pieces sold as a set $600.00 + shipping. Overall appearance is very good to excellent & it was working when removed from service. There are no books or microphone with it. Each piece has a metal case w/ faux wood grain covering. Front panel & markings on all three units are excellent. The only observed problems with these units are as follows: Receiver has a few light rust spots on the transformers & chs. Transmitter has few light rust spots on the transformer. SSB15 Transmitter has 1 spot of chs rust & there is a good deal of flaking of the faux wood grain case covering on top.

MARK Sidewinder SSB27: 2 units available at $100.00ea + shipping. Both have a metal case & the overall appearance of both is very good. No power cords available. 1:Blue case few paint chips & a few dings in the grille. 2: Brown metal case flaking. Factory(?) mod ASB11A adds adds USB AM.

HAM gear.
TMC FFR3 military receiver w/ 8-16mcs tuning drawer. Overall appearance very good. Rack mount. Top cover & power cord missing. Not tested. $150.00 +shipping

National receiver NC300. Overall appearance very good, some paint scratches. Not working, hum only. $200.00 + shipping.

Audio equip
Dyna Mark III mono power amp 1 available priced at $250.00 +shipping (or $190.00 w/o tubes) Overall appearance is very good to excellent, works very good. Has 2 brand new RCA US made 6550's.

Heathkit W5M mono power amp, 1 available priced at $195.00 + shipping. Overall appearance is very good. A little rust on cage, Chs is dirty but no appparent rust & markings are all very good. Some rust on the choke. Has 2 Genelex KT66's, works VG. Missing fuse & cap.

Rogers stereo integrated amp HG88 priced at $200.00 +shipping. Overall appearance is very good but brass front panel has many small spots on it. They will probably polish out ok. Made in London. ECL 86 outputs.. Works very good.

TUBES-All military boxed.
GL 8020 GE $40.00 +. 3 available
6U7G RCA $2.00 +. 15 available
12J5GT SYL VT135 $2.50 ea + 11 available.
717A Western Electric $20.00 ea. 4 available.
+shipping

Prices are fob Baltimore , Md. Offers will be considered on any of
the above items.

Dave,

I'd go for the 40 meter unit. 15 meters is great when it is open, but
that is sporadic. 40 is open most of the time (in one fashion or another)
and will provide the most contacts. Enjoy!

Regards,

Paul - W9JTO

Replace the trimmer caps thsi should solve the trouble. Look at
www.icomamerica.com under service FAQs. There will be some information
on the IC-745 and 751 / 751A radios.

FOR SALE: odds and ends gear, cross posted to various groups.

Hallicrafters S-53A multiband SW receiver. Very good condition. band selector needs cleaning. $80.

Pioneer open reel (1/4" 2-track stereo) RT 707 reel to reel. in very good condition. I've hardly used it. $100.

Teac A-2340SX 4-track 7"X1/4" reel to reel. $250.
Matching Teac 2-A 6-channel mixer with MB-20 4-meter bridge, $80.
Will sell as a set for $300. Both work great. I have made some great demos with this deck.

Boss OD-2R dual overdrive pedal. In box, used only once, excellent condition, $50.

Boss RV-70 digital reverb. Occupies one rack space. Excellent condition. 1 yr. old. Original box and manual. $90.

Roland Juno-106 analog synthesizer. A classic. Perfectly functioning. $200.

Silvertone single-cutaway 6-string electric guitar. Logo is worn off, but it is definitely a Silvertone. Original sunburst paint intact. Not a Danelectro. Fretboard is a little bumpy. Stays in tune... mostly. The tone is warm and wonderful. There is no case, but I will ship safely. Would restore nicely. $100.

If you are interested in more than one of these items, I will cut you a deal. Photos can be available for all if you are seriously interested (I can send jpegs via email or snaps via snail mail.)

Buyer pays shipping, or maybe not, depending on your location and how much you buy.

yes it will work just fine. You will not need the controller for the
706 as then control is built into the radio.

I have a ts930 with the stock kenwood 500hz filters, and want to install the IRC 2.1khz and 270hz filters. INRAD is not able to find the ts930 documentation, and I have the ts940 info, but would like to verify some things before I warm up the iron. I intend to use the dim switch to switch between the cw filters, and recieve through the 2.1 filters when in SSB. I would really appreciate hearing from anyone who has the relevant documents.

Thanks in advance.

cheers, Paul

: Thanks,..... Jim

The FT-8000R does not have any part of the 900Mhz band blocked.
It has unbroken coverage from 894 to 1300 Mhz.

Barry

>I'm sure the day will come when I smash the piece of shit. I think i'll
>go back to my first hobby which is large caliber handguns.
>
>Steve KC6DXT

For example Kenwood uses a wider based audio bandwidth modulation
scheme and on a Bird 43 average reading meter it appears to be making
more power. Since ICOM filters their audio to a more narrow bandwidth
the " average " power will be less on a Bird 43 average reading meter
as there is not as much bandwidth to average. Kenwoods audio is a bit
like DSB reduced carrier that is where the low bassey audio comes from
where the ICOM audio is a more pure SSB narrow type of audio.
AND Yes I know Kenwood is not actually doing DSB.

If the transmitted bandwidth is narrow, then there is not as much as
average power to be read by the averaging meter. That is exactly what
you meter is telling you. it is not saying the radio only puts out 30
watts. Most needle meters are simply not fast enough to properly
measure the output of a SSB transmitter as that type of meter can not
follow the instanious output power as a scope can. I almost never use
a meter do not trust them unless for FM work.

Grab a scope and make the measurement your self. You will see either
radio output 100 watts peak power.

You place both radios side by side and you will not have one out talk
the other.

><jtonti@hotmail.com>

The MT-500 is an old, channel element radio that is great, as long as it
is already on the frequencies you want to use. Main problems are the cost

of new or recrystalled channel elements, even refurbs can run 40 or 50 bucks a piece (and you need two for every channel you want to talk on!). Next, the availability of OEM parts, for example, the TX/RX switching is controlled by a tiny relay that is no longer made. While their are a great number of 500's out there, Motorola shops are getting away from supporting them.

Third, assuming you wanted to sink the money into buying new/refurbed elements into the radios, retuning is needed. And depending on what bandsplit they are in, some modifcation might have to be made to the reciever's preselector and a few capacitors might have to be changed. (Especially on T-band 470-495 and low split 403-430MHz versions.)

Fourth, the PL /DPL tone is set by a tone reed and PL or DPL processor. One tone per radio.

I wouldn't put any money into them personally. While they are tough, rugged, simple no nonsense radios, the mere cost of retuning and servicing the radios sends me packing. For the cost of having a 4 channel MT-500 set up, you could buy a brand new GP-300 16 channel synthesized portable, with scan, multiple PL/DPL, and full 438-470MHz perofrmance. And reprogramming is done with a PC, without ever opening the radio.

Used GP300's sell for around 300- 450 dollars. A more sound investment than sinking money into MT-500's or MX-300's. Or you can pick up HT-600's, 2 or 6 channel synthesized radios from about 175- 250 dollars, and parts are plentiful. Programming is also done from a PC, but the useable bandwidth is not a wide as a GP300 or HT/JT/1000.

Message-ID: <5rkann$e9a$1@brie.direct.ca>
Source record: 169182

I'm looking into buying a new Dual Band HT and would like your comments.

I need a the following:
- 5 Watts
- and to be able to monitor both 2 bands at the same time.
- Mod for TX on 170Mhz, Rx 800Mhz Cellular & Rx 900Mhz
(it's still legal in Canada, but I need to be able to monitor my companies
paging transmiters to see if they are transmitting or not)

I currently have a Icom W2A, but the battery pack leaked and acid sucked right
into the radio and damaged several componants.

Any comments are welcome.
Please email me at: brucelee@thepentagon.com
since I don't read this newsgroup very often.
Thanks

I guess we've all seen the advertisements from Kenwood, Yaesu, Icom and Ten Tech, for "Buy this rig and hear stations you've never heard before!"...

Ok, assuming money was no object (yeah, right!), out of the radios you've used, what radio has the best receiver available in todays market? I mean, which manufacturer is coming closest to living up to their advertisements? Any of them? Is it all hype - are all the radios basically equal in the same price class?

You don't have to quote stats and figures, I'm just interested in your (ham) opinion for the "best" receiver available in a transceiver today...

Much appreciated!

Excuse the none Ham request. Want to sell the following to buy more ham gear:

(all great condition)

Mamiya M645J Body
80mm 2.8 Sekor C Lens w/ Hood & UV Filter
110mm 2.8 Sekor C Lens w/ Hood & UV Filter
PD Prism Finder S
(2) 120 Film Inserts
Deluxe L Grip Holder
Film Advance Crank
Aluminum Suit-case Style Case

Also additional filters:
58mm VaraCross Filter 2mm
58mm Polarizing Filter
58mm Diffusion Filter
58mm UV Filter
58mm 80B
58mm Polarizing Filter

Asking $800 OBO

Brad,
I don't know that any human can tell whats the best. Test instruments probably can. My best (subjective of course) pick of receivers is, not necessarily in order:

Yaesu FT-ONE w/all filters
Kenwood TS-450 w/all filters
Kenwood TS-940S AT and 950 SDX

I know there will be dissagrement here, but too many hams think they "save some money" by not buying all the filters they can get and therefore can't cut out stations on either side. Lack of filtering costs them contacts.
I bet the Yaesu FT-1000D and MP are bad asses too! Just never owned one of them. Yet!

Butch KF5DE

Congratulations on your test. I strongly recommend you to buy ADI
AT-600 Dual Band Handheld. This is a VERY GOOD radio and very
inexpensive. You are looking around $269 US (If you buy a radio
now, you will get a $30 rebate + free speaker-microphone)

Also if you are not interested in listening / transmitting outside of
ham band, Radio Shack's HTX-202 is a way to go. This handheld
doesn't pick up any garbages [well... not true, but less].

Good luck.

Too bad... I am leaving BC this week... You don't see me anymore !!

Les..
The TS-520S would be a fine radio for you. They go for around $300 in good condition. The 6146 finals are rugged and are good for about 120 watts output. They are still available and not too expensive. The problem is that accessories for older equipment are usually expensive and go for more money than they are worth due to demand.
The matching VFO would be nice to have since it can't be replaced with anything else.To opperate split as for 40 mtr DX it would be worth having .... maybe $75 to $100. The MC50 mic is normally over priced. I sold mine for $35 four years ago.They go for up to $60 now. You can use any high impedance mic such as a Shure 444 or Astatic D104. The phone patch is virtually worthless as is the homebrew digital display....no resale value to speak of. The matching speaker would be nice but not necessary as the rig has one built in. Maybe $25 for the speaker. The antenna tuner would also be nice to have ... maybe around $100 to $125. You can always use it with any rig. But there are alot of new tuners available around that price range.
As I said before the accessaries bring more money since hams like to have matching equipment and there is a demand for accessories. You should get a break for buying the whole station but dont forget the rig is only worth $300....dont over invest!

>
> KA7SFL / HP1XYO

Tom,
The SB-220 and SB-221 use 2 Eimac 3-500Z's. The SB-221
did not include 10 meters, although there was a 10 meter
conversion kit that you could install. Basically, the kit
was a 5 position band switch, etc. If you had the
kit, the amp went together using the SB-220 manual.
I know, because I did it.
The SB-230 used a single Eimac 8873 I believe.

I have a radio that I managed to pick up for a song. Anyhow is it a Maxon Electronics SM-3010. It is new in the box however I think it is around 1989 manufacture. The power out is 40 watts the frequency range is 148-174. It uses diode matrix PPL for frequency control. The thing has 6 channels that appear to be set by cutting diodes to set the frequency. I was hoping to maybe use it for packet on 2 meters or something on 2 meters being as it seems it would tune down just a tad. Does anyone have any info on this radio? or does anyone know how to tell what series of diodes might select which frequency? Or is it a piece of junk..... Thanx in advance!

Source record: 168997

I have had my TM-V7A about a month now. At the same time I acquired the TH79A handheld. The remote and repeat modes make this a great pair. The V7A receiver is very hot. The features are amazing. It is the best ham radio I have ever had.
If you get one, keep the manual handy. ;)

The only negatives I have found so far:
The display is not as easy to read during the day as I wish it were.
The mike audio is always hot in transmit. Have to unplug it for repeat mode. (There is a fix for this but I have not done it yet.
You can't set an auto mute on one band while other is in use. This would be nice.

2580. Astron RS-50A Power Supply Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-30 00:00:00 UTC
From: "Robert G. Schaffrath, N2JTX" <rschaffrath@acm.org>
Message-ID: <33DFFB7E.463A@acm.org>
Source record: 168998

I have an Astron RS-50A Power Supply which may have a problem. I have had the power supply since 1989 but never ran it more the 1 1/2 hours or so. Lately I have let it run for 4-7 hours and I noticed that it gets extremely hot. Just for the heck of it, I opened the top with the power off and found that I could not keep my hand on the transformed because it was too hot. I am running a Kenwood TM-741 in receive mode off of the power supply (about 1.5 amps drawn) and I was wondering if anyone has noticed their Astron RS-50A power supply getting hot. It seems to put out power but I am thinking there might be a slight short internally.

Source record: 169000

Robert,
While I don't have the rs-50, I do have 2 rs-35 power supplies. I have run them both continously for months on end. They supply power to 2 kenwood hf rigs I use for a pactor bbs. With the rigs in receive mode the outer cases are cool to the touch and only get warm after an extended period of transmittiing (10 to 20 minutes). After a long forwarding session (maybe a hour) they do get quite warm to the touch. I would think your heavier power supply would handle a 1.5 amp load and stay cool to the touch. If you have an ammeter you may want to check how much current the astron is using (at 120 volts) to provide the 1.5 amps your transceiver is using. Good luck! I'd like to have one of those beefy supplies but just to pricey for me. stan/kb8jlv

I'm not sure where Jan Is coming from with this reply.

1. What would make you assume this is a business band repeater?

2. The FCC hasn't licensed techs in the land mobile services for years,
anyone can do it. Especially a ham.

3. Get yourself a communications specialists encode only ctcss board
I think AES sells them about $25 for the encode only version.
It's a three wire hookup, not to hard.
good luck and 73

Regarding your problem with AES:

I can tell you that I have spent (literally) thousands of dollars with
this company, order-
ing for myself and other friends and I can honestly say I have NEVER
experienced trouble with them. They are courteous, prompt and I usually
get my order within a day or two at the outside.

I would strongly recommend that a.) You give them an opportunity to
explain and make it right and, b.) You be cautious in posting negative
things like this without fully exploring the reasons with upper
management.

We are all forced to deal with delays at times, but this does not
constitute a "bad" com-
pany and your admonition to "beware" seems a bit hasty. Give em a call
and talk to the front office, I am sure they will stumble over
themselves to make it right.

I have know more EXTRA's who could not even manage to solder on a PL-259 than I can shake a stick at. I had a hard enough time getting the code down for my poor old tech (in 1976), now a tech plus, I would not want anyone else to have to go through that. I am in favor of harder written tests though.

Jeff

Uhhh Jeff, it's electromagnetic theory, with radio just a small subset.
And you will shortly be exposed to more than just an "interesting"
amount of it! >;)

But for now, just drop down to the OSU library and check out a copy of
the Amatuer Radio Handbook published by the American Radio Relay League
(ARRL). It's heavier than the average Physics textbook, but ten times
more fun. I would suggest Antennas, by Kraus, but that's a very tough
book for anyone, and totally inappropriate for you at this time.

> I have built DiPole antennas for my CB radios and then blown and replaced
> pre-finals in my radio (didn't know what I was doing and tried to set up
> di-pole in room tied to door knobs). I then set up a quarter wave antenna,

Sounds like a good start for an RF engineering career! Most of us RF
types go through a period of mass destruction before we reach anything
near being productive.

> Antron 99 which is a really nice antenna tuned to 27.255MHZ which has so
> many db of gain, which means nothing to me and Websters is no help, 144
> db= Airplane noise level?.

Wait a minute here! You're in EE at OSU, and you use a general purpose
dictionary as a technical reference? Maybe you meant that "you will be a
sophomore" in about 9 more years? You do understand base 10 logarithms,
and how logarithmic notation can help you to handle very large and small
numeric values? Consider that the airplane reference is to acoustic
pressure (sound pressure level), and has nothing to do with the dB's
used to reference RF power. Remember that dB's are unitless, and are
used only to indicate a ratio to some defined reference level.

> I know what isotropic is with regards to the
> etching process of silicon wafers. I have no idea what it means here. ARG.

Well, I don't know anything about "isotropic" in that sense, so you got me there! Still, that's a bit advanced for a freshie, and more like chemical engineering or materials science.

> What do I do.

Well, your post is reasonably articulate. We can't do a career development analysis here, so I suggest you take this post and show it to an EE prof. He needs to tell you how to investigate problems and use resources. And, if you are maybe only about 10, email me and I'll be happy to describe some of these things in simpler and, I hope, clearer terms for you.

PS: Nice bright blue web page you got there!

2605. CTCSS on Kenwood TR-7850

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-30 00:00:00 UTC
From: mikemo@ibm.net
Message-ID: <33DF4804.772F@ibm.net>
Source record: 169060

Please pardon my ignorance, I'm a newbie.
I have a TR-7850 2 meter mobile that I would like to use with the local repeater system. They require a "103.5 Hertz tone" to access the repeater. I'm assuming this is the CTCSS tone. The owners manual for the rig does not say anything about CTCSS, but it does have a "tone" button, and in the manual it says it has solder points on the board for adding a "tone encoder". Kenwood does not sell one.

Is this the place that I would add a 103.5 Hz oscillator? Does anyone make an adjustable one (for use on different repeater systems).

Thanks for the help!
Mike M.

2607. Comet SMA-501 ??

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-30 00:00:00 UTC
From: Jim Valdes <jvaldes@whoi.edu>
Message-ID: <33DF4F7D.D7E23280@whoi.edu>
Source record: 169062

I just received a Comet SMA501, ~~2 inch SMA style "dualband" antenna.
Has anyone else have any experience with this antenna? Based upon my
experience I would not characterize it as a "dualband", the performance
on 2 meters is dismal, I could barely hear the local 2 meter repeater.
440 is about as expected.
I made a couple of quick bench measurements with a spectrum analyzer
using the stock antenna on my FT-50 as the reference. Referenced to the
stock antenna I found the Comet to be:
- 33 dB at 146.52 !!!!!!!!!!!!!!!!!!!!
- 4 dB at 446.00

Don't get me wrong, I could live with a -10 db performance on 2 meters
but at -33 dB it's a dummy load!

Is the antenna I have defective, how does yours perform?

Thanks, Jim, WA1GPO

The 170.245 MHz frequency is governed under FCC Part 90, 90.265.a/b. It is usable by eigibles (Sec.a; Power, Petroleum, Forest Products, Special Industrial, Business and Railroad Radio services) for low-power, wireless microphone operation subject to the following:
1. The emission bandwidth shall not exceed 54 KHz
2. Output Power shall not exceed 50 mw
3. Stability shall be +/- 32.5 KHz of assigned freq.
4. Unprotected from interference from other licensed operations in the band. If Government or non-Government users are interferred with, operations must cease. Also, applications are subject to Government (Federal; other than FCC) coordination.

Summary, if you're not one of the listed elgibles, its not legal. However, given the Friendly Candy Company's record of enforcement in the amateur bands, it's likely you could put up a KW wireless mic and never receive a notice of violation. Only public safety frequency interference is still treated as a serious matter at the Commission nowdays.

Hope This clarifies.

Regards,
Rick Tannehill, P.E.
Ariz. Dept. of Public Safety

Is this the new SMA version of the much (and long ago) discussed
"Miracle Baby" BNC antenna? I think someone posted that it was just
resistively swamped, which would account for the dismal performance.

These simple "swamped" type antennas can be useful (especially on HF)-
as long as you know what performance to expect from them- and that's why
I'm wasting space here (this is really a poke at QST)! Some years ago
(10?) QST reviewed a similar HF type antenna from MaxCom (I think) and
really skewered them (also stopped running MaxCom ads). I wonder if QST
accepts any ads from Comet (I stopped subscribing years ago)? Anyway,
the last time I checked ICOM's commercial marine catalog, they offered
an HF "swamping" type tuner right alongside their more expensive HF
auto-tuner. A quick check of the RACAL home page also indicates a
similar antenna is offered for their new multimode 30-512MHz military
handheld radio. Of course RACAL also offers "resonant" single band
antennas for the product. Just my $0.02.....

If you cannot get an MRF477 from RF Parts (1-800-RF-PARTS), then you
can try an MRF497, which is a higher power version I believe.

Regarding my DSP-59x, I love it, but I wish it killed a little bit more noise without having to filter the phone audio so much (during real bad DX conditions). Other than that, works great. Maybe I should change the default jumper setting in the unit to optimize it for phone, as I don't operate RTTY or any HF digital mode. I've got firmware v3.0, for what that's worth. The only occasional problem I see if when leaving the unit on for extended periods (<6 hours) is that when I come back to the rig, there are times that the filtering somehow changes or crashes, causing a low volume level (even with the gain button depressed) and very heavy filtering (too much for communications to occur). I've found that turning the unit off and on again makes the condition go away. There is a knob position where the unit will memorize the filter setting intentionally, but I haven't used this, nor is this the cause of my glitch. Maybe my particular unit has a bug. I don't know. I wouldn't hesitate buying a second unit based on my experience. I use mine with a Kenwood TS-430s in the shack, but wouldn't mind having another one in the mobile. Good piece of equipment, all-in-all.

Hope this helps.

> PRS-101 (Cat. # 19-901); standby time, signal clarity, etc.?
>
>

The Radio Shack PRS-101 is currently being closed out for $69.00 and is
a good value at that price. I owned a pair and generally thought they were
ok as basic radios. I used them at flea markets and never had problems with
the batterys giving out as long as I ran on low power.
(over 4 hours use on average)
I did run out on high power after about 3 1/2 hours of moderate use.

Batterys:
One problem with these radios is the availability of spare batterys.
I never was able to locate a second source (other than Radio Shack) for
these batterys.

Receiver sensitivity:
Sensitivity is ok but not as good as some other GMRS units.

Repeater operation:
If you intend to do repeater operation, you can't. These radios will not
work duplex and have no pl tone capability.

Build quality:
I would rate the quality as only fair. The radio seems rather cheap compared
to other GMRS radios I have seen.

My choice for basic radio:
Currently my favorate radio is the two channel Radio Shack PRS-100 or Maxon
GMRS21A. For my use at swap sales, this radio easily outperforms the PRS-101
in both sensitivity and battery use. If you only need two channels and want
a very well built radio, I highly recommennd you locate a pair of these.

Maxon still makes them so batterys and accessorys are readily available.
The Radio Shack is only available used, but the battery packs are the same
for both radios.

We have bought them for as little as $25.00 each to as high as $50.00 on the
used market just in the last year.

It is important to note that the Radio Shack version (prs-100) operates on
two interstitial channels, whereas the Maxon GMRS21A is on two of the main
channels. Make sure you stick with the same brand. The Radio Shack is

the most prevelent on the used market, so that is what I went with.

Take care!

I'm going to guess that this is a VHF business band repeater.

You need to send your radio to a qualified, FCC licensed tech to
modify your radio. Do not attempt to do this yourself. Doing so
may make you radio emit in a portion of the spectrum for which
you are not licensed.

I can't belive that a HAM would ask this quesiton....

Jerry,

I have noticed that a lot of equipment from the 50s and 60s being put back on the air. There seems to be some increasing AM activity and CW is still CW. Your Viking II may have some value for the vintage collector and you Matchbox was probably one of the best antenna tuners made. (prejudiced, as I have one... hi) I also had an SX 110 in the early and mid 60s but even then found it to be tough going on the amateur HF bands and it need a pre-amp on 15 and 10. I used it as a tuneable IF for VHF converters and it did good duty there. As a CW receiver it would probably work out ok, especially with the crystal filter. If you are interested in selling it you may want to post it on the rec.radio. amateur. boatanchor newsgroup. Better yet, get re-licensed and put it on the air :)

Yes, it is. Communications Specialists sells one that you program with
dip switches for about $25; Ramsey also has one, but we all know about the
quality of Ramsey stuff... If you are planning to make your own, use a 10
or 20 turn trimmer to set the frequency.

-I'm going to guess that this is a VHF business band repeater.

Why? He states in the second sentence that it is a 2 meter radio...

-You need to send your radio to a qualified, FCC licensed tech to

Not for ham radios, you don't.

<snip>

I recently bought a Kenwood IF-232C right here on the newsgroup. It did not come with cable. I made a cable from scratch, plugged it into my Kenwood R-5000 receiver, and ran the KENTROL program and everything happened automatically.

If your cables are correct, it could be your software settings (although Kentrol worked with no setup other than telling it what radio it was talking to).

Also, your cable could be a MODEM cable that has pins 2 & 3 swapped. This may not work and a straight-thru 25 pin cable may be more appropriate. I just used a cable I had and it worked first time.

Also, the Kenwood R-5000 has to have the interface kit (which consists of 2 chips) installed internally in the radio (IF-10? kit) which enables the rear port to actually function as a serial port! This kit is NOT a part of the IF-232C. Does your transceiver require this or is this capability already built-into it?

Source record: 169091

I was wondering if I could get some comments on the NC-50 slide in charger... Is it worth $90? And when you buy the adapter for the batery to slide into, do you get one or two (For $25 or whatever)???

I've got another question... When you transmit (on an FT-50RD) with the external DC adapter (E-DC-5B) does it matter how strong the battery is that is attached? A weird thing happened - my battery was about dead, so I plugged in the power supply (2A)... when I tried to transmit, the voltage dropped to about 4 volts, and a split second later it stopped transmitting. What the hell is with that? It just went back into receive, even with the PTT pressed. Is there something wrong with my radio?

Good luck.
I wouldn't want to be caught dead with that software. Motorola seems
relentless
in their efforts to prosecute those caught using that software.

Hey Raj!

Yes there is because I did it to mine. It required a couple DIP relays and used the display hold switch. Worked great because you did not have to turn the IF Shift to receive RTTY and those dual 500hZ filters really helped. The mod was in an old (198?) RTTY JOURNAL. I got rid of the info when I sold my 830 years ago but maybe someone still has it.

Hiya Dave:

Fancy meeting you here. I have been looking for this mod for sometime.
What twigged me on to it was a similar mod for the Yaesu FT-757. I have
had this posted for a couple of weeks now and information is just
starting to trickle in.

If you manage to lay your hands on it or the reference in the RTTY
Journal I would be very appreciative.

Hello,

I wonder if anybody can help me to get a Maxon SL500 programed for the 70cms amateur band.

At present it's got two channels set, but can have up to 99.

Can you help me out with details of the microphone connector and/or a program to run on a pc to program this radio. I understand it's an RS422 interface into the radio, I have a converter from RS232 to RS422.

I have also managed to turn on the SelCall, but cannot turn it off.

73 David.

>
> cross-band repeat mode are violating FCC regs?

I'd say yes, you are correct. However, you can flip over on the 2m
output
and transmit your call every ten minutes, thus causing your radio to ID
with your call sign on it's 440 output. This, as far as I can tell,
would satisfy
the requirements. The other possible "cover" is to have the trustee of
the
repeater you are repeating act as a trustee/control op for your 440
transmitter, which is probably not likely. :)

2658. VX-1R LITHIUM BATTERY????

Anybody out there know about lithium batteries. Can you recharge the lithium battery without memory effects like with nicads, or are they one in the same?
the batteries are expensive, at $37 bucks each. also bought the "FBA-20" which is the alkaline battery holder (only holds one 1.5v battery). drop me a line and let me know. the manual really did not cover it that well. so far i do like the radio, there are limitations of course, but that was to be expected with such a small size.
works here in the albany, ny area fb. Greg

Jason:

Check the VHF receiving section of the ARRL handbook. The 6 meter GaAs FET has the coil values for 10 meters also. Think the dual gate MOSFET design might also have the values.

Basically, the input inductor should be around 1 to 2 uH. On a yellow T-37-6 core, I wound 22 turns of magnet wire, and the input tuning capacitors resonate fine. Have also used slug tunable coils.

The output circuit, a 100 ohm resistor to a 6 volt regulated source with a series coupling capacitor is fine. Resonant circuits have too much gain...about +25 to +30 dB of gain which makes the S meter/AGC kick up high and steal away your dynamic range.

I've found that the dual gate GaAs FET works great on 10 meters! I can hear the noise floor all the time in my quiet location. Disconnect the antenna, and the receiver is quiet. Measured over 3 dB S/N improvement compared to the Icom IC-751A's built in preamp. Also helped with my FT-990. Just wired up to my TS-820S with even more impressive results.

73s,
Woody AK2F

2660. AT-600 mod info?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-31 00:00:00 UTC
From: Fred Grambs III <fgrambs@panix.com>
Message-ID: <5rqe63$dfe@news1.panix.com>
Source record: 168961

I recently purchased the ADI AT-600 radio. It works well, good audio output, clean tx, and packed with features.
I have done the software mods and discovered that the receive is not too reliable at 330-405 and 470-500. I assume the hardware mod will make the receive more reliable. Before opening the radio, I would like to know where Q220 (the component listed in SoCals ADI mod page) is located on the board.

Thanks,
Fred

Body handling: HTML body converted to readable text

Hello,

A while back I got my first CB, a Cobra 18RV. I did not have an antenna, so I simply put up an old mini-TV Dipole antenna in my attic, I ran the wire down, and simply connected it to the antenna conector. I didn't ground the radio, I didn't even have anything leading out of the outside part of the antenna connector on my CB. I found performance to be OK, not horrible, but yet not quite good. I got up to 5 miles range. Then the mic went out on the radio. I found out that a new mic from Radio Shack is $14.95, but I paid $15 for the CB, so I thought it would be cheaper to just get a new CB. So I did. I found a brand new, in the box, Cobra 19 Ultra for sale at a flea market for $25, so I bought it. The unit was brand new. I got the whole thing together, but I already had taken down my mini-TV dipole in the attic. So now I went searching for a base CB antenna. I got one for $7 at a flea market, and I also got a SWR/Power meter too. The antenna is about 9 feet high, and came with a small mag mount base thing, which obviosly didn't belong on this antenna. I got the proper adapters from Radio Shack, and put it in the highest point in my attic. I used a cable TV wire by changing the plugs on each end to run it down. Now, when I key the radio (remember, this is the Cobra 19, not the 18RV) I see the radio's build it S-RF/Power meter go all the way max to the red part. From my expirience, this means that the antenna is performing well. My base power supply is a old train set power supply, which has a variable meter that goes from like 3 volts all the way up to about 14 volts. I run it at 14 volts, and the radio's meter seems to be showing that the power supply is fine. I also have an external SWR/Power meter, but I don't know how to use it. I didn't get the instructions with it. It's a Radio Shack Micronta meter, with a switch that switches between "ref" and "fwd", and a small whole in the middle which reads "FS ANT", and also a tuning dial that reads "CAL". I have found that my range has decreased alot, I now get about 2 miles. Could this be because I'm using a Cobra 19, and not the 18? The Cobra 18RV is almost twice as big as the 19, but the 18RV has three weather channels, and the 19 doesn't. Could it be simply because the 19 is phisicly smaller in size? The 18RV is an older model, I would guess 1990 or 1991. The 19 is brand new. Both radios perform excellent when mobile with a mag mount, I sometimes get up to 20 miles. Please help me with this installation. What am I doing wrong? Should I install the SWR meter and see what happens? I know that a 1:1 match is perfect, and if the second number is high then it's a bad antenna match. But I do not know how to work the SWR meter. I also tried adding ground. There is a small screw on the back of the 19 where you can hook up a wire to ground, and I tried it by putting the other end of the wire around a metal nail and putting it into the

lower part of an electrical outlet which is ground, but I did not see a diffrence. Please tell me what I am doing wrong. My operating location is also somewhat low, surrounded by some hills, but nothing major. Please advise me.

Thanks alot,
EugeneD@aol.com

The VX-1R batteries should not exhibit any memory effects.

Probably better discharging all the way to reduce the number of cycles, tho. Just a guess on this!

Pssed on the alkaline holder myself: Very low TX power/time. Might be good for listening, tho.

Actually, I was pleased at the cost of the spare battery. The ones for my other radios (e.g., FT-50) were MORE expensive!

The quasi-rapid recharge is a very nice feature.

Phil

>I don't think I have ever seen an invisible matching network.

altavoz: DUH , thats why they call it invisible , dummy .

>>altavoz:
the much better 5/8w vert match to 50 ohms , so don't settle
for a 1/4w ant as it's lobe on the horizon is lower power and
thats what we need is power(alias gain) .
One exception ! If your sailboat heels alot , a 1/4w
might be better as the 5/8w loses gain as
you tilt it . I'm defining gain as that useful stuff you get
>> from a real antenna !

>Ed:
I can't tolerate this any more. You nitwit, the "useful stuff you get
from a real antenna" is called radiated power. And gain is the measure
>of efficiency and directional characteristics of that radiated power.

altavoz: YOU NERD ! The useful stuff is gain pattern , not radiated
power.
Try communicating with some one if you have much radiated power , but
50%
of it's going up at a 45 degree angle and he's on the horizon 20 miles
away . DUH ! What a nitwit , novice , wanna be sparky .

2669. Kenwood's Deals for the TM-V7A and TH-79AD-FYI

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-31 00:00:00 UTC
From: KJ6HC <cuyeda@ix.netcom.com>
Message-ID: <33E184EA.6C3E@ix.netcom.com>
Source record: 168970

Just to let everyone know about Kenwood's deals. There is an instant coupon deal for the TM-V7A for $50.00 off! The TH-79AD is $30.00 off! The dealers say this is a limited offer and won't last long. So if you are planning to buy one of these radios, you should consider it now.

There are also free fannypacks for the purchase of the TH-79AD and a nice Stanley travel mug for buying the TM-V7A. I wish I could get the 24 hour Kenwood clock for buying a TS-570D/S, but I already bought mine.

FYI- for those who care...

2671. FS: Tubes, Tubes, Tubes Galore!

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-31 00:00:00 UTC
From: godzilla@panix.com
Message-ID: <5rqn04$o2r@panix3.panix.com>
Source record: 168972

Some time ago, the old and now defunct Civil Defense radio room in downtown Manhattan yielded a cache of unused radio tubes. The existance of these tubes were brought to the attention of NYC ARES-RACES by one of the agencies clearing out the old room.

The tubes were boxed and placed in storage in Maspeth, Queens Co., NY. There are 132 different types of tubes, a total of 3,234 different tubes. They have NOT been tested. They are available for inspection; appointments can be made to check them out (send a message to nycmetro@juno.com).

We are looking to generate funds to buy equipment for public service communications. Purchase of the lot of tubes can also become a tax deductible donation through NYC METRO, Inc. Best offers will be entertained.

If you are a tinkerer, have lots of old-time tube equipment, or know of a museum or other organization looking for such items, here is a chance to buy many uncommon tubes. You may request a complete list of tubes by responding directly to Barry Schwartz, N2SHP, at godzilla@panix.com.

Thank you and hope to hear from interested individuals soon!

Sorry for calling you a nitwit; I should have used something more profound, and clinical. And further, of course I'm a nerd! Who else ruminates about antenna theory at 0200? And since you are wasting your precious life in this dance, what does that make you? Perhaps jester to the nerds?

> Try communicating with some one if you have much radiated power , but
> 50%
> of it's going up at a 45 degree angle and he's on the horizon 20 miles
> away . DUH ! What a nitwit , novice , wanna be sparky .

Do you mean like maybe setting up a horizontal dipole, cut for maybe 3.5 MHz, and placing it about 3 meters above the earth? Gee, Mr. AV, that's a bad idea, huh? Why, I bet you'll say that I'll never get any RF

squirted out toward the horizon. But who needs a direct path to the horizon when you can radiate straight up (yes AV, straight UP), and then, by ionosphere bounce, right back down again. So I can talk with the guy who lives BEHIND that hill 20 miles away. Poor AV; your mind is focused on the horizon, while so much goes over your head. You can say "DUH" now. :) [cheap smiley just for AV]

And yes, I really am a sparky. But not a Novice, actually a Tech, for about 30 years.

Yep, Normal for Astron RS-50A supplies. I have the Astron RM50M (Same
transformer) It is in repeater service. Even with its 8 A drain with
repeater and 1 amp standby, it gets almost too hot to touch on the
transformer. But it has been in service since 1989 that way and no
problems! Note: I use to run more power on repeater and max current
drain was 30 Amps, for those fixing to flame me for using such a bid
supply)

I have 9 Astron supplies, the only ones I had problems with were the
RS-35A which crowbared every lightning storm, until I did the mod.

Mike,

The questions you posed in your original post were very clear. Perhaps the person who jumped on you is from an area where no one has ever heard of a 2m ham repeater that requires CTCSS and jumped to the wrong conclusion.

Anyway, welcome to ham radio. I think you'll find that the vast majority of hams are helpful and willing to help newcomers.

I looked at the schematic of my RS35M, and it does not have a high temp
cut-out. I was incorrect on that.

>
> What experence has anyone had with the Icon IC-821H multi mode dual
> band, 2M/70cm band (144 - 430 MHz) and the Kenwood TM-261A FM only rig.

I have a TM-261A, which I bought new in January, 1997. It performs well, and it holds up much better in the face of strong intermod than my old TM-241A did. It seems to be a bit easier to program than the 241A also. It still bugs me that I had to buy the CTCSS decode board separately (a $60 option) but nearly all handhelds come with it as a standard item.

I've had no electrical problems or computer glitches with the 261A, but I have experienced some performance problems. First, I have encountered severe blanking on 146.92 MHz as I was driving past the 147.38 MHz repeater site... .38 completely killed the receiver on .92 until I was about 1/4 mile away or so, then it stopped. Second, I had the 261A's receiver gradually go dead on me one time, apparently due to severe heating of the rig. I had been engaged in a long-winded QSO (over an hour) at high power (50 Watts output) as I drove along on the way home from work. The heat sink on all of those new compact rigs is really not designed for long-duration, high-power QSOs, so it came as no surprise that the rig was scorching hot. Once I let it cool for about two minutes, the receiver was back just fine.

I have no experience with the Icom rig.

> >Tom

There is at least one big problem with using your own rig in "cross-band repeat" mode. If, for instance, you're using it to repeat your 440 HT into a local 2 M Repeater, if your "repeater" radio picks up interference,
intermod, or other hams on the 440 side, you will retransmit this into the 2 M repeater. You can reduce this somewhat by having tone squelch or
code squelch on the "Handy talky" side, but you may still cause problems.
If you're doing two-way crossband repeat, the offending ham won't even hear the noise on his HT. I've heard this happen a number of times lately.

I've also heard it said that crossband repeat is always in violation of the rules unless the repeating radio is under the control of a control operator. There are only certain provisions in the rules to allow unattended operation, and using your base rig or mobile rig to extend the range of your HT is not one of them. I haven't checked this out in the rules myself yet, though.

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their crystal controlled, transistor Plectron and Motorola desktop monitor receivers. They have now been replaced by battery operated portable pagers, and the desktop models are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. They are desktop models which can be powered from 117VAC or 12VDC with the proper mobile cord. The audio quality of a Plectron P1, Plectron 700 series, and Motorola Alert Monitor is far better than any consumer grade scanner and the sensitivity, image rejection, and intermod immunity is outstanding when aligned properly.

The Plectron and Motorola Alert monitors are single band receivers: VHF-low, VHF-high, or UHF. No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

AC power cords for both types of receivers use unique connectors and are scarce. You can buy them new but it's much cheaper to drill a hole on the rear panel and attach a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. You can also get Plectron repairs and parts from:

Northeast Communications
4 Oak Ridge Rd
Newfoundland NJ 07435
201-697-8804

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

Plectrom SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model UHF VHF-high VHF-low

SM-301 X X X
SM-302 X X
SM-303 X X
SM-304 X X

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) /
10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

I currently have no Plectrons or Motorola Alert Monitors
for sale. I'm hoarding them. :-)

>the gain is doubled.
>
>Chris is right.

No, he's still wrong. Neither antenna is an isotropic source,
and the dipole operates *above the groundplane too* (well
above the groundplane for a free space model). We don't
operate dipoles with one half buried in the ground, that's
the conceptual flaw in your model. None of the main lobe
contribution of the dipole is lost. It is exactly the same as
for the monopole over perfect ground.

Both antennas place their main lobe normal to the radiator
(gain is given as the strength of the signal in the main lobe
compared to the average signal strength in all directions),
and both develop the same far field pattern (the dipole does

so directly and the monopole does so with the aid of ground reflection causing constructive and destructive interference which forms the antenna pattern). Because both do radiate equal power, there will be equal field strength from the two antennas at equal distances (in the ideal models being considered). Thus the two antennas will have equal gain.

PLEASE NOTE! To reply, please delete the "nospam" from my e-mail address.
Thanks

Here's what I have to trade for a dual or tri-band mobile (must be no older than 4 years):

-3D glasses, "High Resolution" PC-based "CyberShades 3-D" with parallel interface, everything you need, and these games: Descent, Wolfenstein 3D, Depth Dwellers, Virtual Slingshot, Word Rescue and Math Rescue. In original box with all original parts. $75

-Computer vacuum, uses 4 AA batteries. 2 attachments. $5

SOFTWARE
-Ecco Pro 4.0 by NetManage for Win 95 & NT on CD. Time management, contact management, project management, information sharing. On CD. $25
-MS Flight Simulator 95, unregistered in original box. $25
-Bible Study Software, "Ultimatum Pro" 23 Bible translations, 20 maps, Thompson Chain, Strongs, Easton's Bible Dict, Matthew Henry's Concise Commentary, Wesley's Notes, Barne's Notes, Harmony of Gospels, John Gill's Notes, Eclectic Notes, Robertson's NT Word Pictures, Peoples Notes, Scofield's Notes, OB Green's verse-by-verse, Spurgeon's Readings & Catechism, HB Sightler's verse-by-verse, much more. Latest version on CD. $50
-Lucaino Pavarotti! "Messun Dorma" Palatrussardi - Milano. Will play on Mpegs (PC & Apple/Mac), Video CD's, Amiga CD32, 3-DO. $5
-808 Great Letters. The Ultimate Letter Writing Tool. CD for Windows. $8
-Phone Book, 2 Million Fax Numbers 1996, Windows 3.1 or Windows 95, 1 CD. Retail $29.95. Asking $5
-1996 Census data on US Households on one CD for Windows. $5
-Fonts, 300 HandWriting Fonts on one CD, For Windows. $8
-Fonts, 300 Kids Fonts in 12 categories, very unusual and fun fonts on one CD. $8
-Clip Art, 4000 images on two CD's. $10
-Screen Saver, Life's Little Instruction Book, for Win 3.1 or Win 95, on 3.5", 511 color graphic suggestions, observations, & reminders on how to live a happy & rewarding life. $10.
-Romantic Adventures, A practical & fun software package that will help you manage & improve your intimate relationships. Complete with romantic ideas, a journal for tracking, helpful hints. New for $58.01. Asking $10.
-Diet, Menu Planner, Wight Loss Planner, Executive Diet Helper. for Windows on 3-CD Set, $10

ELECTRONICS
-Stereo System, JVC (CA-MXC7TN) integrated system. 6+1 CD changer, dual

cassette w one-button CD record, clock, on/off timer, full remote control, seperate amp for sub-woofer, SEA graphic equalizer with 5 modes of display (dual peak, peak hold, dual reverse, reverse, peak line), Compu-link Source Related Preset System, 40 programmable memory radio stations. This IS NOT a low end junk unit. I paid $722.50 for this system (will e-mail copy of receipt as necessary). Absolutely NOTHING wrong with this unit. Comes with speakers with subwoofers. An amazingly clean, no-distortion and loud system. Asking $325.

-TV-Combination VCR. 20" Panasonic Omnivision. One year old. Closed caption, automatic clock set, auto-daylight savings time, auto repeat, cable box universal remote control, on-screen setting, one minute video skip (for commercials), one month x 8 program auto timer recording, one touch recording, PanaBlack Picture tube, digital auto-tracking, special effects playback, 181 channel TV/CATV tuner/all channel auto set. Paid $600, asking $325.

-Personal Information Manager, Sony Magic Link, PIC 1000. 32-bit CPU, touch sensitive LCD screen for both finger and stylus, internal data/fax modem, built in speaker and microphone, infrared beam communication, PCMCIA II slot, serial interface port for PC connection, built in electronic messaging (e-mail), fax, and telephone calls, word processor, Quicken, AOL, spread sheet, database, games, rolodex, time manager, much more built in. Comes with connector to your PC and software, telephone earplug/microphone, AC adapter, carrying case, all original packaging and boxes. Has two hours of use. Software never opened. Can upgrade with full size keyboard, pager built in, wireless Internet surfing. $549 retail. $250 for bundle.

-Hanging oil-drip lamp with statue in middle. (Make sense?) You know, one of those lamps that hang from the ceiling that has a statue in the middle and fishing lines running at a slight angle from top to bottom. Mineral oil slowly runs down the fishing lines. In perfect, clean, working condition. $100

-Pocket digital voice changer. Fits in your pocket, just place over the mouth-piece of any telephone. Uses 3 AAA batteries. 16 high to low voices. New in box, bought for $39.95 + ship/handle, Asking $25.

-Mobile HAM 2 meter, HTX-212 Radio Shack, 45 & 10 watts, true FM modulation, 31 memory channels, CTCSS, DTMF, Dual VFO and Duplex, Extended band coverage (136-174 MHz), in new condition, in box, $170

-Dual Band Yagis, Cushcraft's new A270-6S for 2m and 440, 7.8db gain, 350 watt max, bought in June 97 for $72, asking $50.

-Police Scanner, mobile, Pro-2026, 100 channels in 5 banks. Owners manual. $125

-Police Scanner, desktop or mobile. Bearcat 250. 5 banks of channels, AC or DC, digital clock, search function. $85.

-Telephone recorder. Turns on tape recorder when phone is lifted. Records both sides of conversation. $12

-Learning Machine, is an audio based hardware/software system
that is comprised of a headset & light shield, & connects to
any standard audio CD player or CD-ROM drive. Software for the
Learning Machine is digitally encoded onto the included CDs.
The CD's contain programs that educate, entertain, & stimulate
the imagination. Kit includes everything needed EXCEPT your
CD player. In perfect, new condition. Bundle cost over $300.
Asking $100 for all. Disks included:

-Mini Language Lab, Italian, German, Spanish, French.
(5 disks 1 manual).
-Inquizo-Kids Adventure Series "The Northwoods." Join
4 adventurous kids as they stumble into a deserted cave
& unwittingly solve the greatest mystery their town
has ever known. Suitable for young children. (1 disk).
-The Photographic Mind. Your intellectual & emotional memory.
(1 disk & 1 manual).
-SuperPhonics. Learn to read the fun & easy way. (1 disk & 1 man).
-Super Vocabulary. Learn 500 words plus meanings for 100'2 more.
(1 disk & 1 manual).
-Triggers. The power of the learning machine igniting the
possibilities of your mind. Motivate, neutralize fears, increase
learning abilities, expand creativity, program performance, help
your body heal, relieve emotional pain, erase self defeating
messages, release hidden energy, harmonize inner conflict,
release bad habits, discover the new hypnosis (1 disk & 1 manual).

* Additional disk titles are still sold through several vendors.

-Power Pack, Rechargeable heavy-duty Battery perfect for portable ham, CB,
or pocket TV's. 12 Volt 4000mAh. $30

-Antennae for Cell Phone, suction cup, inside car window, 5db gain. $9
-Antennae for Cell Phone, "On Window" 5 dB Gain Cellular by Mobile Mark
(model OW-5-900). $5.
-Antennae for Cell Phone, pivots from 45 degrees to 90. 3db gain. $9
-Antennae, amplified TV/FM/AM, compact round 5.25" disk shape. New $39.
Asking $10

-Electric Pencil Sharpener, Boston, heavy duty. $5

-Volt Sensor, to detect 100-600 Vac by placing near by a live wire. uses 2
AA batteries. $5

-Telephone strobe flasher and bell. Select between ringer, strobe or both.
$5

MUSICAL EQUIPMENT
-Harmonica, Hohner CX-12. $169 new, asking $85

JEWELRY
-WWII issue stainless steel watch band in original box. "Berkeley Lifetime
Watch Band" $10
-Ring, USMC Diamond/Gold/Onyx men's, 10k & black onyx with 1/3 k. diamond,

Jostens, lifetime warranty & re-sizing . (new $950) - $375.
-Pendant, Pewter Raven pendant, 1.25" round two-sided, hand carved. $15
-Pendant, Pewter Raven pendant, 1.5" round single-sided. $15
-Pendant, Pewter Raven pendant, .8" x 1.25" rectangular single-sided. $15
-Pendant, Pewter Raven pendant, 3.5" two-sided. $15
-Pendant, Silver 1" Raven holding .5" onyx marble pendant, single-sided. $15
-Pendant, Silver globe w brass continents chime pendant. (Chimes inside of ball). $18

POLICE/SECURITY/GUARD Equipment
-Portable Locker. 5.5" x 4" x 1.5" box with cable and internal combination lock. Perfect for locking keys or other personals in box to pole or inside car with cable lock. New for $29, asking $10
-Thumb Cuffs, stainless, not a toy. $10
-Kubaton, 5.5" long, self defense keychain. $3
-Compass, Military issue, "NSN 6605-01-196-6971". $38

MUSIC COMPACT DISKS: $6 per CD
-Aretha Franklin "What You See Is What You Sweat"
-Sarah Vaughn "Collection" 24 songs on 1 CD
-Paula Abdul "Shut Up And Dance"
-George Michael "Faith"
-Billy Idol "Vital Idol"
-Boston "Don't Look Back"
-Boston "Walk On"
-Phil Collins "Dance Into The Light"
-Journey "Time" 3 CD box set $18
-Foreigner "The Very Best and Beyond"
-Styx "Classics"
-Kansas "The Best of Kansas"
-Def Leppard "Pyromania"
-ZZ Top "Greatest Hits"
-Beastie Boys "The In Sound From Way Out"
-Pink Floyd "Pulse" 2 CD Box set $12
-Hank "Are You Insane?"
-Red Henry "Gravity"
-Berkley's Best "Home of the Hits Revisited"
-1980-1984 "20 Rock and Roll Hits"
-1980-1984 "19 Love Song Hits"
-1980-1984 "20 Dance Hits"

CHRISTIAN MUSIC COMPACT DISKS: $6 each
-Johnny Q. Public "Extra-Ordinary"
-Grammatrain "Lonely House"
-Phil Keaggy, True Believer
-Lanny Cordola's "Of Riffs & Symphonies"
-Larry Howard's "Cornerstone Blues Jam"
-Bright Star Male Chorus "He Will Answer Prayer

That's true, though any tuning network required will result
in greater antenna *system* losses than for an antenna which
does not need a tuning network.

>thats what we need is power(alias gain) .

A 5/8ths-wave antenna does *not* have a low angle unless it is
operated over a very large and conductive groundplane. If you
operate it over 1/4-wave radials, its elevation angle is even greater
than the 1/4-wave antenna. If you do have such an excellent
groundplane, then a slightly shorter vertical (0.6-wave) will have
an even lower radiation angle than the 5/8ths-wave antenna.
(That's why they are used by MW broadcasters when an omni
pattern is required.)

>What do I do.

Isotropic in terms of antennas means the radiation is coming from a point source (a geometric point), and that it radiates equally in all directions. This is only a theoretical construct since you can't really make an antenna behave as a point source, but it is convienent for mathematical analysis.

Antenna gain can only result from taking energy from one direction and adding it to another direction. Unlike the gain of a power amplifier, you can't get more power out of an antenna than you put in, you can only redirect it in a useful direction. Conventionally, antenna gain is given as a ratio of the power in the main lobe compared to the average power in all directions from the antenna. This ratio is expressed in db as follows

db = 10*log(P1/P2)

Where P1 is the power density in the main lobe (watts/cm^2) at a certain distance, and P2 is the average power density over the surface of a sphere centered on the antenna and having a radius equal to the distance where the main lobe measurement is made. For an isotropic antenna, that is simply the total radiated power divded by the surface area of the sphere. Thus gain over isotropic is the easiest gain to calculate. With other antenna forms, you have to use calculus (or a whole lot of measurements) to determine the average power over the sphere's area. (For a real antenna, in some directions the power density will approach zero, while in at least one direction it will equal the power density in the main lobe.)

Hello to those who responded and others,

I am very sorry to report
Due to a power surge here at the QTH I have lost a lot of the
responses to my original Email on this subject, as well as all my
email addresses.

So I have to start over from scratch and I will add some more details

I have forsale 2 amplifiers that work from a commom power supply and
have a common metering deck. Both amps are rack mounted as is the
power supply and metering deck.

Both amplifiers were in a working station when they were removed. I
have not fired up either amp since I have gotten them.

The reason I am selling is I do not have enough time to operate all
the bands I would like to.

Amp 1

This is a pair of 4cx250b. I have 2 spare tubes. This is the
"Plumbers Delight " amp. and is in good condition

AMP 2

Is a single ended unit that is not nearly as good shape. It uses a
single 4cx300 and I think it is for 432 mhz.

There are no switching relays included with either amp.

If you are interested please call
1-860-485-0355 before 10pm east coast time

or email PaulC@snet.net

I would rather have a pick up on these units since the power supply is
so heavy.

Will also consider toward trade of HF amp. Must cover the WARC bands

Thank you

PaulC

Jim, I had one for a while and sold it. I thought it was pretty dismal, too. But -33 dB sounds horrendous. I don't doubt your measurements, but I am surprised that anything called an antenna can be a factor of 2000 down from the average-at-best stock antenna for this radio. Wow! Thanks for sharing this info.

2692. Cross band repeater operation

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-31 00:00:00 UTC
From: trneal@ix.netcom.com
Message-ID: <33dffef0.756383@nntp.ix.netcom.com>
Source record: 169012

Most mobile dual band radios now come equiped for cross-band repeater operation. In this mode, you can use a HT tuned on the 440 MHZ band, to transmit to your mobile radio which cross-band repeats your signal onto the 2 meter band. Likewise the mobile radio will cross-band repeat from the 2 meter band (output of a repeater) back on to the 440 MHZ band to be recieved on your HT.

As I understand the FCC regs, it is required to have automated station IDing on the 440 MHZ output of the mobile radio. However, I don't know of a single dual band modile radio which provides the capability for automatic IDing. Does this mean that everyone using their radio's cross-band repeat mode are violating FCC regs?

Anyone have practical advise here? I would really like to use the cross-band operating mode on my mobile radio.

Thanks,

Tom

>n4nr@vulcan.com

Dennis,

The power supply has an SCR that fires, and shorts out the output of the
supply, to protect the equipment connected to it, in the event of an
over-voltage condition.
Removing power, and re-applying would reset the SCR.
The 0.76 volts would be the voltage drop across the SCR simiconductor
junction. normally 0.7 volts across a diode.
The commercial AC power going on and off can produce a large voltage spike
on the line. Lots of VCR's and TV's are blown out this way.

Robert,

Any transformer will get hot. As long as it does not start to smoke,
it is running within it's design limits.
I am an industrial electrician, and have been sent out on trouble calls
where someone thought a motor, or transformer was too hot to the touch,
and found nothing wrong. I tell them the same thing- as long as it is not
smoking, it is running OK.
There is a type of voltge regulating transformer that gets so hot, you can
burn yourself on it, but it is designed to run under those conditions.
I am not sure, but I think Astron has some sort of high temperature
cut-out device in their supplies anyway.

>>can't understand what the antenna has to do with this, especially the
>>VCR. Any help? (Our radio guy is away at a hamfest.

You did say you were using an antron99. All of my friends with cbs and this antenna all have these types of problems. This antenna is known as a splash stick by many. Adding the ground plane kit may help a little, but I think you should invest in a different antenna like the macco 5/8 wave verticle with ground plane radials. It can be cut for 10 meters or an inexpensive tuner can be used. Just an idea..

Jan Allbright <wharfrat@pcisys.net> wrote:

What the heck are you talking about? All he is looking for is a tone board to access a 2M repeater. And since when does a ham have to send a rig to a technician to do simple mods and repairs such as adding a tone board. If you would read the questipn, he is not looking to transmit on 103 mhz, he is looking for a 103 hertz tone.

And in answer to the question, Communication Specialties makes a board, I am not sure if Kenwood's TU-79 will work for the 7800 series rigs, but they are the plug and play diode matrix type board for the 7900 series units and may in fact be adaptable to the 7850.

Source record: 169025

david,
i have an ft10R, and have had similar problems (on 2 different units).
Apparently the external DC supply is not able to handle the full demand
of the radio on xmit, and just acts like a charger and "supplementer".
if my battery is low, and i transmit just after plugging in the external
supply, i find that i'm on a new frequency when i get back to receive.

It's not a great thing, and i was wondering if the charging contacts for
the desk chargers might be able to be able to supply the higher current
needs, but that would mean the radio would have to sit in a cradle
during operating.

I guess that's why there are mobile and HT models sold. Have to expect
to trade off something to get a small HT. great radio otherwise, though
i wish the squelch worked better.

I have the 20 amp Astrons (two). I had one sitting atop the other and the heat from the bottom one actually melted the damn little stick-on rubber feet and the black goo ran down the side of the unit. Took forever to find something to remove the stuff with without removing the finish on the Astron.

These units have never been turned off in 3 years except for the several times I tried cleaning them. I bought some real rubber feet from hardware store and epoxeyed them on. You know what cleaned up the gooey mess? My wifes hair spray. No shit! Kay told me it was mentioned in Helen's tips or something like that, that Several hair sprays made good cleaner/removers. Cool!

I agree 100%! I've had many rigs in my shack, and have found the differences to be subtle at best. I'm selling my nice FT-990+ and downgrading to a cheap TS-820S. I'll take the difference and put it in the bank.

If you are using the mobile to repeat both the 2M and the 440 Signals, most likely, you are violating the regs. When you tranmit on 440 (with your handheld), you will ID your handheld AND the crossband repeater (The mobile rig). When a 2M signal is repeated, there is no ID.

If you are using the crossband repeater to link to a repeater, a possible solution would be to use a dual band handheld and to have the mobile repeat ONLY the 440 signal (which you ID when you ID your handheld). you would then listen to the out put of the 2M repeater on the handheld. Admittedly, this would only open the fringes of the repeater coverage where you could thill hear the repeater but didn't have the signal out to bring it up.

Even this practice MAY not comply to the letter of the law as far as ID'ing. It certainly complies with the intent. I do not know of this being fully interpreted by the FCC.

It certainly would be nice if the manufacturers would build in an ID'er when they build a remote controlable crossband repeat function.

I did a lot of backcountry skiing and hiking this spring (and into the summer). I did run into a couple of situations where such a set up would have been useful, but fortunately, didn't have the need. (I did leave my mobile in "RC" mode, set up to uni-directionally repeat).

Hope this helps.

If you can I would put the money into an antenna. I have had
similar experiences where I had my expensive rig perform closely with
my portable receiver. However, a good antenna vs a poor one makes a
considerable difference.

Good filters also can really help in selecting out signals in
a crowded band. Depending on your antenna - filters may be a good
choice. However, a directional antenna can help alot in selecting the
signal you want to hear (or talk to).

Just my two cents :-)

Motorola makes the JT1000 portable radio. It is almost identical in size
and performance to an HT1000 (Jedi series). It has a front panel LCD
display andkeypad, looks like an MTS-2000 from a distance.
It offers 16 programmable channels and is offered in VHF high band
(130-175MHz), UHF Lo split (403-470MHz), and UHF Hi split (450-512MHz).
Programing can be accomplished from the keypad, and has a built-in menuing
system, but you must buy the "field programming fixture" which attaches to
the radios universal connector. Or, the radio can be programmed via RIB
and software, through an IBM PC or compatible. (8088 on up).

It's pricey, expect to spend about double on what you paid for the U16,
but it is a heck of a radio. It has PL/DPL/.Quick Call, singletone,
MDC600/1200 STAR 800, DTMF ANI, scan, etc. The radio has full bandsplit
performance (no degredation on any model) and has a heck of a better
reciever than the U16.
Haven't seen many used, they are a rarity.
For more info, check out Motorola's web page at:
http://www.mot.com for more info.

Hi, I just got a GP300 and I'm looking for some accessories. A
battery, numeric pad whatever?

thanks Keith - keithbel@execpc.com

2716. ASTRON 35 Amp Mod

Newsgroup: rec.radio.amateur.equipment

Due to all the requests, I am posting the crowbar mod here.

Astron has inplemented this into the new switch mode supplies that they build (Crowbar is not the only reason).

The mod involves adding 2 parts:

A 120 or 130 degree, normally closed thermostat (I have a limited supply of these for a price).

A 12 Volt computer variety fan.

This mod will keep you from running to your repeater or packet sight every time after your ASTRON RS-35A Crowbars.

STEP 1 Mount the fan on the heatsink of the supply blowing in (Be sure to usa a fan guard so your fingers wont get cut by the blade). ANY 12 volt fan will do as it's primary purpose is just to keep the temp below 120 or 130 degrees.

STEP 2 Use your choice of method to wire the fan to the 12 volts.

STEP 3 Mount the thermostat on the inside of the supply coupled to the heatsink (As good as you can get it).

STEP 4 Use your choice of method to hook the thermistor in series with the power switch of primary of the transformer.

OPERATION:

As long as there is 12 volts, the fan runs, the heatsink stays relatively cool, and the thermistor stays closed.

When the supply crowbars 2 things happen:

1. There is no longer voltage to run the fan.

2. The heatsink starts heating up. The over current limit limits the current and all of the voltage is dropped across the transistors, which heats them up fairly fast.
